KEY TO PRONUNCIATION.

a as in fat, man, pang.
ā as in fate, mane, dale.
ä as in far, father, guard.
â as in fall, talk, naught.
à as in ask, fast, ant.
ã as in fare, hair, bear.

e as in met, pen, bless.
ē as in mete, meet, meat.
ė as in her, fern, heard.

i as in pin, it, biscuit.
ī as in pine, fight, file.

ū as in mute, acute, few (also new, tube, duty).
ů as in pull, book, could.
ü German ü, French u.

oi as in oil, joint, boy.
ou as in pound, proud, now.

A single dot under a vowel in an unaccented syllable indicates its abbreviation and lightening, without absolute loss of its distinctive quality. Thus:

ạ as in prelate, courage, captain.
ẹ as in ablegate, episcopal.
ọ as in abrogate, eulogy, democrat.
ụ as in singular, education.

A double dot under a vowel in an unaccented syllable indicates that, even in the mouths of the best speakers, its sound is variable to, and in ordinary utterance actually becomes, the short *u*-sound (of but, pun, etc.). Thus:

a̤ as in errant, republican.
e̤ as in prudent, difference.
i̤ as in charity, density.
o̤ as in valor, actor, idiot.

ä̤ as in Persia, peninsula.
ē̤ as in *the* book.
ṳ̄ as in nature, feature.

A mark (⌣) under the consonants *t, d, s, z* indicates that they in like manner are variable to *ch, j, sh, zh*. Thus:

t̰ as in nature, adventure.
d̰ as in arduous, education.
s̰ as in pressure.
z̰ as in seizure.

th as in thin.
ŦH as in then.
ċh as in German ach, Scotch loch.
ṅ French nasalizing n, as in ton, en.
ly (in French words) French liquid (mouillé) l.
′ denotes a primary, ″ a secondary accent. (A secondary accent is not marked if at its regular interval of two syllables from the primary, or from another secondary.)

SIGNS.

< read *from;* i. e., derived from.
> read *whence;* i. e., from which is derived.
\+ read *and;* i. e., compounded with, *or* with suffix.
= read *cognate with;* i. e., etymologically parallel with.
√ read *root.*
* read *theoretical* or *alleged;* i. e., theoretically assumed, or asserted but unverified, form.
† read *obsolete.*
★ refers, in all cases, to material which will be found in the supplementary pages. It is used in the cross-references, and is also placed above (rarely below) the initial letter of a word, when an addition to its definitions will be found in the supplementary pages at the end of one or another of the various volumes.

SPECIAL EXPLANATIONS.

A superior figure placed after a title-word indicates that the word so marked is distinct etymologically from other words, following or preceding it, spelled in the same manner and marked with different numbers. Thus:

back[1] (bak), *n.* The posterior part, etc.
back[1] (bak), *a.* Lying or being behind, etc.
back[1] (bak), *v.* To furnish with a back, etc.
back[1] (bak), *adv.* Behind, etc.
back[2]† (bak), *n.* The earlier form of *bat*[2].
back[3] (bak), *n.* A large flat-bottomed boat, etc.

Various abbreviations have been used in the credits to the quotations, as "No." for *number*, "st." for *stanza*, "p." for *page*, "l." for *line*, ¶ for *paragraph*, "fol." for *folio*. The method used in indicating the subdivisions of books will be understood by reference to the following plan:

Section only	§ 5.
Chapter only	xiv.
Canto only	xiv.
Book only	iii.
Book and chapter Part and chapter Book and line Book and page Act and scene Chapter and verse No. and page	iii. 10.
Volume and page	II. 34.
Volume and chapter	IV. iv.
Part, book, and chapter	II. iv. 12.
Part, canto, and stanza	II. iv. 12.
Chapter and section or ¶	vii. § or ¶ 3.
Volume, part, and section or ¶	I. i. § or ¶ 6.
Book, chapter, and section or ¶	I. i. § or ¶ 6.

Different grammatical phases of the same word are grouped under one head, and distinguished by the Roman numerals I., II., III., etc. This applies to transitive and intransitive uses of the same verb, to adjectives used also as nouns, to nouns used also as adjectives, to adverbs used also as prepositions or conjunctions, etc.

The capitalizing and italicizing of certain or all of the words in a synonym-list indicates that the words so distinguished are discriminated in the text immediately following, or under the title referred to.

The figures by which the synonym-lists are sometimes divided indicate the senses or definitions with which they are connected.

The title-words begin with a small (lower-case) letter, or with a capital, according to usage. When usage differs, in this matter, with the different senses of a word, the abbreviations [*cap.*] for "capital" and [*l. c.*] for "lower-case" are used to indicate this variation.

The difference observed in regard to the capitalizing of the second element in zoölogical and botanical terms is in accordance with the existing usage in the two sciences. Thus, in zoölogy, in a scientific name consisting of two words the second of which is derived from a proper name, only the first would be capitalized. But a name of similar derivation in botany would have the second element also capitalized.

The names of zoölogical and botanical classes, orders, families, genera, etc., have been uniformly italicized, in accordance with the present usage of scientific writers.

P

★ **1.** The sixteenth letter and twelfth consonant of the English alphabet, having a corresponding position in other alphabets. The scheme of parallel forms, as given in the case of the other letters (see especially *A*), is as follows:

Egyptian. Hieroglyphic. Hieratic. Phenician. Early Greek and Latin.

The usual Greek Π was made by extending the originally short second perpendicular limb; the Latin (whence our) *P*, by curving the same around to meet the perpendicular (see *R*). *P* in all these alphabets stands for the same unvarying sound: namely, for the surd labial mute (corresponding to *b* as sonant, and *m* as nasal), made with closure of the lips, during the maintenance of which closure there is complete silence, its character being brought to light by explosion upon the following sound. The *p*-sound is in English much less common (below a third) than the *t*-sound, and slightly less common (about four fifths) than the *k*-sound. The character *p* has no varieties or irregularities of pronunciation in English save as it is silent at the beginning of a few Greek words, as *psalm, pneumatic, pteropod*, and, much more rarely, elsewhere, as in *receipt, accompt*. It enters into one important digraph, namely *ph*, found in numerous words of classical origin, and pronounced as *f* (but originally as written, or as an aspirated *p*, a *p* with an audible *h* after it, as in our compound *uphill*). (See *ph*.) According to the general law of correspondence, a *p* in the Germanic part of our language should represent an original *b*; but *b* appears to have been almost altogether wanting in the primitive language of our family; and hence our *p*, when not of classical origin, or borrowed from elsewhere, is the result of some irregular process.

2. As a medieval numeral, 400; with a dash over it (P̄), 400,000.—**3.** As a symbol: (*a*) In *chem.*, the symbol for *phosphorus*. (*b*) In *math.*, the Greek capital Π denotes a continued product. Thus, $\prod_{1}^{m}{}_{\rho}(1+\rho)$, for which $\Pi(1+m)$ is also written, denotes the product $(1+m)\,m\,(m-1)\ldots 3.2.1$. The small Greek letter π denotes the ratio of the circumference to the diameter, or 3.14159265359+. This notation was used by W. Jones in 1706 and by Euler in 1737. The other form of the Greek minuscule, ϖ, denotes in astronomy the longitude of the perihelion.

4. An abbreviation: (*a*) Of *post* in *P. M.*, *post meridiem*, afternoon, and *P. S.*, *postscript*. (*b*) [*l. c.*] Of *page* (*pp.* standing for *pages*). (*c*) [*l. c.*] In *music*, of *piano*, softly (*pp.* standing for *pianissimo*, very softly). (*d*) [*l. c.*] In a ship's log-book, of *passing showers*. (*e*) [*l. c.*] In *zoöl.*: (1) Of *partim*. (2) In dental formulas, same as *pm*. (3) In *ichth.*, of *pectoral* (fin). (4) In echinoderms, of *polyplacid*. (*f*) In *med.*, of (1) (Optic) *papilla;* (2) *pupil;* (3) *pugillus*, handful.—**To mind one's p's and q's.** See *mind*[1].

It is one of the largest rodents, though far inferior in size to the capibara, and is a near relative of the agouti and other cavies. Its length is about two feet, and its stature one foot. The body is robust, with coarse close-set hair of a variable brownish color above and whitish below, with several streaks or rows of spots of white on the sides. The head is large and broad, with obtuse muzzle; the tail is a mere stump; and the inner digit of each foot is reduced, the others being stout and hoof-like. The animal is somewhat nocturnal, spending most of the day in burrows, often several feet deep, dug usually in moist ground near watercourses. It is a vegetable-feeder, sometimes injurious to crops, and its flesh is edible. See cut under *Cœlogenys*.

> She made three *paces* thro' the room.

2. A lineal measure of variable extent, representing the space naturally measured by the movement of the foot in walking. In some cases the name is given to the distance from the place where either foot is taken up, in walking, to that where the same foot is set down, being assumed by some to be 5 feet, by others 4⅔ feet—this pace of a double step being called a *geometrical pace*, or *great pace*. The pace of a single step (the military pace) is estimated at 2½ feet. The Welsh pace is 2¼ English feet. The ancient Roman pace, the thousandth part of a mile, was 5 Roman feet, and every foot contained between 11.60 and 11.64 English inches, hence the pace was about 58.1 English inches.

Metallic packing, in *mach.*: (*a*) A system of packing in which metal is used, as metallic rings for piston-packing. Such rings are either so cast as to be elastic, or they are divided into segments and fitted with springs to press them against the interior of the cylinder so as to form a steam-tight contact.

In 1786 he [Cartwright] devoted himself to improvements, which include *metallic packing* to the piston in the steam-engine, which he patented in 1797 and 1801.
A. Barlow, Weaving, p. 235.

(*b*) Tubes of lead or other soft metal filled with some vegetable material, such as hemp or cotton. The ends of the tubes are either forced or soldered together.—**Oil-well packing**, a packing inserted between the pipe and the interior surface of the boring in an oil-well to keep surface-water, or water from the sides of the hole, from running into the well, and to prevent oil in some wells from being forced out around the pipe by a pressure of gas. The packing originally used was a leather bag filled with flaxseed, called a *seed-bag*, made in the form of a ring. The flaxseed, swelling on being wetted, closed tightly the opening to be stopped. This packing swelled so tightly as to be very difficult to remove—a difficulty which led to the invention of many substitutes. One of these is the modern water-packing, which consists of an annular leather packing, concave on the upper surface, surrounding the pipe, and held in position by a screw-joint. The weight of the superincumbent water presses this packing closely against the interior of the bore. Another form of oil-well packing, which stops efflux of oil under internal gas-pressure, as well as influx of surface-water, is shown in the accompanying cut.

Oil-well Packing.
a, an elastic substance surrounding the main tubing; *b*, the ordinary coupling resting on the washer *c*, their surfaces ground together and made water-tight; *d*, a loose nut running upon a screw-thread cut on the main tubing; *e e*, elliptic springs, dovetailed or otherwise fastened to the sides of the loose nut *d*, and partially clasping the tubing at *f*.

pæon (pē'on), *n.* [= F. *péon* = Sp. *peón*, < L. *pæon*, < Gr. *παιών*, a song in honor of Apollo, a metrical foot (see def.), < Παιών, a name of Apollo: see *pæan*[1].] In *anc. pros.*, a foot consisting of four times or syllables, one of which is long, the other three being short. According to the position of the long in the first, second, third, or fourth place respectively, the foot assumes four forms, distinguished as *first pæon* (– ⏑ ⏑ ⏑), *second pæon* (⏑ – ⏑ ⏑), *third pæon* (⏑ ⏑ – ⏑), and *fourth pæon* (⏑ ⏑ ⏑ –). The pæon has a magnitude of five moræ or primary times (*i. e.*, is pentasemic), its resolved form being the pentabrach (⏑ ⏑ ⏑ ⏑ ⏑). Three of these times belong to the thesis and two to the arsis, or vice versa (⏑ ⏑ ⏑ | ⏑ ⏑, or ⏑ ⏑ | ⏑ ⏑ ⏑), so that the pæon belongs to and is the type of the hemiolic or pæonic class of feet. Only the first pæon and the fourth pæon were in use in pæonic verse, the contracted form, known as the *Cretic*, being, however, more common; the second and third occurred in verses analyzed by the ancients as mixed Ionic, or epionic. The Cretic (⏕ ⏑ | –) was sometimes known as the *pæon diagyios*, as distinguished from the *pæon epibatus* (⏕ | – | ⏜ | –), in which each short of the pentabrach was doubled (*i. e.*, represented by a long). The pæon received its name from its original use in compositions in honor of Apollo (see *pæan*[1]). See *diagyios*, *epibatus*. Also spelled, less correctly, *pæan*.

One species was named by Linnæus *P. alexandri*, on the supposition that it was that mentioned by Onesicritus, a historian of Alexander the Great. These birds are known as *ring-parrots*, from the characteristic collar around the neck. *P. torquatus* is the common ring-parrot of India, in parts of which country it abounds, sometimes in flocks of thousands. This appears to be the bird often figured as an attribute or accessory of some of the Hindu goddesses in sculpture and painting, like the owl of Minerva or the dove of Venus. *Palæornis* is the largest as well as the name-giving genus of its group, with upward of 20 species, inhabiting chiefly the Oriental regions, but also Africa. The general color is green, the bill waxy-red in the male, the lores feathered, the tail long and cuneate, the wings pointed, and the form rather lithe. The voice is very loud and harsh, but the birds may be taught to talk a little, and prove tractable in confinement. See cut under *ring-parrot*.

Palæornithidæ (pā″lē-ôr-nith′i-dē), *n. pl.* [NL., ⟨ *Palæornis* (*-ornith-*) + *-idæ*.] The *Palæornithinæ* elevated to the rank of a family. In Garrod's arrangement, the usual scope of the group is extended to include the cockatoos, which are generally placed in a separate family, *Cacatuidæ*; in this case the family is divided into two subfamilies, *Palæornithinæ* and *Cacatuinæ*.

Palamite (pal'a-mīt), *n.* [< *Palam(as)* (see def.) + *-ite*.] One of the followers of Gregory Palamas, a monk of Mount Athos in the fourteenth century. Simeon, abbot of a monastery at Constantinople in the eleventh century, taught that by fasting, prayer, and contemplation, with concentration of thought on the navel, the heart and spirit would be seen within, luminous with a visible light. This light was believed to be uncreated and the same which was seen at Christ's transfiguration, and is known accordingly as the *Uncreated Light of Mount Tabor*. The doctrine was more carefully formulated and defended by Palamas, who taught that there exists a divine light, eternal and uncreated, which is not the substance or essence of deity, but God's activity or operation. The Palamites were favored by the emperor John Cantacuzene, and their doctrine was affirmed by a council at Constantinople in 1351. They were called by their opponents *Euchites* and *Massalians*. Also *Hesychast*, *Umbilicanimus*.

as much in height, with wooden shutters made on the principle of the Venetian blind. It used to be a very common conveyance in India, especially among the European residents, but the introduction of railways and the improvement of the roads have caused it to be almost wholly abandoned by Europeans. In Japan the palanquin is called *norimono*, and is suspended from a pole or beam passing over the top. A similar conveyance called a *kiaotsŭ* is extensively used in some parts of China; it is, however, furnished with long shafts before and behind instead of the pole, and is carried by mules. II. *n.* 1. A palatine bone or palate-bone proper, one of a pair, right and left, of facial bones entering into the formation of the hard palate. They exhibit the utmost diversity of shape and relative size, but preserve constant position and relation in the bony framework of the upper jaw, where they are interposed between the supramaxillary bones in front and the pterygoid bones behind, and thus form an integral part of the preoral visceral arch. In their simplest form, the palatals are mere rods or plates extending horizontally from the pterygoids to the maxillaries. Their connection with the latter is closest, most frequently by fixed suture or ankylosis; with the former it is usually freer, often by movable articulation. There are many modifications of these bones in the lower vertebrates, and in the higher the tendency is to shortening, widening, heightening, and complete fixation, with some connections not acquired in lower animals. Such modifications reach a climax in man, where the palatals have a singular shape somewhat like the letter L, and very extensive articulations with no fewer than five other bones—the sphenoid, ethmoid, supramaxillary, maxilloturbinal, vomer—and with each other. The bone here consists of a horizontal part, or palatal plate, which extends mesad and meets its fellow of the opposite side, thus forming the back part of the bony palate, and of a vertical plate which reaches into the orbit of the eye by a part called the *orbital process*. Each bone thus enters into the formation of the walls of three cavities, of the mouth, nose, and eye; it also assists to form three fossæ, the zygomatic, sphenomaxillary, and pterygoid; it bounds part of the sphenomaxillary fissure, and contributes to closure of the orifice of the antrum of Highmore. The bone furnishes attachment in man to the azygos uvulæ muscle, the tensor palati, the superior constrictor of the pharynx, and both internal and external pterygoid muscles. Notwithstanding its complexity of figure and relations, it is a simple or single bone, developed in membrane from one center of ossification. See cuts under *Anura*, *craniofacial*, *Crotalus*, *desmognathous*, *dromæognathous*, *Felidæ*, *palatoquadrate*, *Physeterinæ*, *Python*, and *sphenoid*.

2. A sound usually produced by the upper surface of the tongue against a part of the palate further forward than that at which our *k* and *g* are made; but sometimes used of any sound made between the tongue and any part of the hard or soft palate. Thus, the German *ch* of *ich* is called palatal, and that of *ach* guttural; the Sanskrit has palatal sounds distinguished from gutturals; our *i* and *e* and *y* are called palatal, as also the compound *ch* and *j*. The term is a loose one, and requires definition as used by any authority.

palatalization (pal''ā-tal-i-zā'shọn), *n.* [< *palatalize* + *-ation*.] A making palatal; a conversion (especially of gutturals) into palatal sounds, as of *k* into *ch*, *g* into *j*, *s* into *sh*.

The *palatalization* of the guttural does not necessitate the u-coloring of the vowel. *Amer. Jour. Philol.*, VII. 238.

palatalize (pal'ā-tal-īz), *v. t.*; pret. and pp. *palatalized*, ppr. *palatalizing*. [< *palatal* + *-ize*.] To make palatal; change from a guttural to a palatal pronunciation.

palate (pal'āt), *n.* [< ME. *palat*, *palet*, < OF. *palat*, **palet* (F. *palais*, arising from a confusion between *palais*, palace, and **palet*, **palé*, the vernacular OF. form) = It. *palato* (cf. Sp. Pg. *paladar*, < L. as if **palatare*), < L. *palatum*, rarely *palatus*, the palate, the roof of the mouth.] 1. The roof of the mouth and floor of the nose; the parts, collectively considered, which separate the oral from the nasal cavity. Most of the palate has a bony basis, formed of the maxillary bones and palate-bones, or of special plates or processes of these bones, the extent of which represents the *bony* or *hard palate*. Behind this, and continuous therewith, in man and many other animals, is the *soft palate*, a musculomembranous fold or curtain hanging down between the back part of the buccal cavity and the upper part of the pharynx, technically called the *velum palati* or *veil of the palate*. The uvula hangs from the middle of the free edge of this velum, and its sides are continuous with the contracted walls of the passage, called the *pillars* or *arches of the palate*, and constituting the isthmus of the fauces. In osteology the term *palate* is of course restricted to the bony parts. In fishes the palate is that part of the roof of the mouth which corresponds to the palatal bones, behind the vomer and in front of the pharyngeals. See *palatal*, *n.*, 1, and cuts under *dromæognathous*, *mouth*, *nasal*, and *tonsil*.

In birds the arch consists simply of the palate-bone, fixed in front and movably articulated behind with the pterygoid, which latter is also movably articulated with the quadrate. A similar arrangement characterizes reptiles; but in fishes this arch may be complicated by the addition of several different pterygoid bones, or in other ways. The paleolithic epoch has been subdivided in various ways by different investigators in various regions. In France some have called deposits containing the rudest flint implements *Chellean*, from the locality St. Acheul near Amiens; other deposits with more finished work have been denominated *Mousterian* (from Moustier, on the Vezère); and those with objects of still higher grades of finish have received the names of *Solutrian* (from Solutré, Saône-et-Loire) and *Magdalenian* (from La Madeleine, on the Vezère). The grand divisions of the Paleozoic are, proceeding upward or to groups later in age, the Cambrian, Silurian, Devonian, Carboniferous, and Permian. (See those words.) These divisions have been designated respectively as the "age of mollusks" (Silurian), the "age of fishes" (Devonian), and the "age of coal or of land-plants" (Carboniferous). The Paleozoic series may, from a paleontological point of view, also be separated into two great divisions, a newer and an older. The former embraces the Cambrian and Silurian; the latter, the Devonian, Carboniferous, and Permian. The older Paleozoic is distinguished by the great predominance of graptolites, trilobites, and brachiopods, and by the meager evidence of vertebrates; the newer Paleozoic, by the number and variety of the goniatites, fishes and amphibia, by the disappearance of graptolites and decline of trilobites, and by an extraordinarily developed flora, largely cryptogamic in character, from which a very considerable part of the coal of the globe has been formed. Rocks of Paleozoic age are spread over wide areas. They are especially important in the eastern and northeastern United States and in the Upper Mississippi valley, in which regions they usually form the surface-rock, being covered only with detrital formations of the most recent age. Almost the whole of the bed-rock in New York and Pennsylvania is of Paleozoic age, and here the various groups of this series were studied out by the Geological Surveys of those States from 1834 on. To the labors of Emmons in New York, Sedgwick and Murchison in Wales and western England, carried on at about the same time with the beginnings of the New York and Pennsylvania Surveys, and Barrande in Bohemia, is due the larger share of the credit of disentangling the complicated structure in regions where the Paleozoic rocks are extensively developed, and it is there that the materials were obtained for the establishment of the Silurian and Devonian systems, which, with the Cambrian, Carboniferous, and Permian, form the Paleozoic epoch.

3. Chemical symbol, Pd; atomic weight, 106.7. One of the rare metals associated with platinum. It was separated from native platinum by Wollaston in 1803, and named after the planet Pallas, which had just before that time been discovered by Olbers. Palladium is dimorphous. It occurs in Brazil n ive, in minute octahedral crystals; and in the Harz it has been found in small hexagonal plates. It is, however, a decidedly rare substance, and the chief supply comes from the working over of the platiniferous residues of various mints. It resembles platinum in appearance, but is harder; its specific gravity is 11.4. It fuses more readily than platinum or any other of the so-called platinum metals, melting, as is stated by some authorities, about as easily as wrought-iron. It is both ductile and malleable, and would be a very useful metal if it were not so scarce as to be expensive and irregularly attainable. The graduated surfaces of some astronomical instruments have been made of palladium-gold, a use for which this alloy is admirably adapted on account of its color and its unalterability in the air. The alloy with silver has been employed by dentists as a substitute for gold.—**Palladium-gold.** See *porpezite*.

They both refer to the effort to make an offense seem less by bringing forward considerations tending to excuse; they never mean the effort to exonerate or exculpate completely. They have had earlier differences of meaning, and *palliate* has a peculiar meaning of its own (see def. 3); *palliate* also would be likely to be used of the more serious offense; but otherwise the words are now essentially the same.

pallium (pal'i-um), *n.*; pl. *pallia* (-ä). [= F. ★*pallium*, OF. *pallion, pallioum* = Sp. *palio* = Pg. It. *pallio*, < L. *pallium*, a coverlet, mantle, cloak; cf. *palla*, a mantle, cloak: see *pall*[1].] 1. In *Rom. antiq.*, a voluminous rectangular mantle for men, corresponding to the Greek himation (see *himation*), and considered at Rome, because worn by Greek savants, as the particular dress of philosophers; also, a toga or other outer garment; a curtain, etc., of rectangular shape.—2. *Eccles.*: (*a*) In the early church, a large mantle worn by Christian philosophers, ascetics, and monks. (*b*) A vestment worn by certain bishops, especially patriarchs and metropolitans. It seems to have come first into use in the Eastern Church, where it is known as the *omophorion*, and to have been worn by patriarchs, and given by them to metropolitans. Some authorities think that it was of primitive origin and at first worn by all bishops, while others hold that it was originally an imperial garment, bestowed by the emperor as a mark of distinction upon patriarchs and others, and afterward given to metropolitans and bishops generally. It has always been of wool, as indicating the pastoral office. It seems at first to have been a mantle rolled together and passed round the neck so as to fall both in front and at the back. It then became contracted in width and was worn nearly as it still is in the Greek Church as a wide woolen band fastened round the shoulders and descending nearly to the feet. In the Latin or Roman Catholic Church it gradually assumed a different shape, and is now a narrow band like a ring, passing round the shoulders, with two short vertical pieces, falling respectively down the breast and the back. It is ornamented with crosses, and has three golden pins by which it is attached with loops to the chasuble. The pallium was worn anciently in the Western Church by the Pope and by Gallican metropolitans. From the sixth century it began to be given by the Pope to some metropolitans outside of his own diocese, in sign of special favor or distinction—at first, according to some authorities, only with approval of the emperor. By the seventh or eighth century it came to be regarded as a sign of acknowledgment of papal supremacy. At present, in the Roman Catholic Church, a bishop elected or translated to a see of metropolitical or higher rank must beg the Pope for the pallium, and receives it after taking an oath of allegiance to the Pope. The Pope wears it whenever he officiates, bishops only on certain great feasts. Anglican archbishops no longer wear the pallium since the Reformation, but it forms part of the heraldic insignia of the archbishops of Canterbury, Armagh, and Dublin. Also called *pall*. (*c*) An altar-cloth; a frontal or pall.—3. In *conch.*, the mantle, mantle-flap, or mantle-skirt of a mollusk, an outgrowth of the dorsal body-wall. It is a specialized, more or less highly and very variously developed integument, including epithelial, vascular, glandular, and muscular structures, and forming folds or processes which represent the foot and other parts. It is often wanting. See cuts under *Lamellibranchiata, Pulmonata*, and *Tridacnidæ*.
4. In *ornith.*, the mantle; the stragulum; the back and folded wings together, in any way distinguished, as by color in a gull, etc.—5. A cirro-stratus cloud when it forms a uniform sheet over the whole sky.

A game, formerly played, in which a ball of boxwood was struck with a mallet or club, the object being to drive it through a raised ring of iron at the end of an alley. The player who accomplished this with fewest strokes, or within a number agreed on, was the winner.

To St. James's Park, where I saw the Duke of York playing *pelemele*, the first time that ever I saw the sport. *Pepys*, Diary, April 2, 1661.

The game might develop into golf or *pell mell*. . . . If the point played to was a hole in the ground, golf arose; if you played to a stone, tree, or rock, or through an iron hoop elevated on a post, *pell mell*, jeu de mail. Pila Malleus was the result. . . . Lauthier describes the attitude and "swing" at *pell mell* in words that apply equally well to golf. . . . Generally speaking, the aim was to "loft" the ball, in fewer strokes than your adversary took, through an elevated iron ring. *A. Lang*, Golf (Badminton Library), pp. 4, 11.

In man the palm is fleshy, and presents two special eminences, the *thenar* (ball of the thumb) and, opposite to it, the *hypothenar*, mainly due to the bulk of the subjacent muscles. The habitual tendency of the fingers in grasping and holding throws the skin into numerous creases, several principal ones being quite constant in position. The character of these creases, in all their detail and variation in different individuals, is the chief basis of chirognomy or palmistry. See phrases under *line*[2].

It. *palma*, < L. *palma*, a palm-tree, palm-branch, the topmost branch, any branch, a palm-branch as a symbol of victory, also the fruit of the palm, a date, also the name of several other plants; so called from the resemblance of the

leaves of the palm-tree to the outspread hand; < *palma*, the palm of the hand: see *palm*[1]. The Gr. name of the date-palm was *φοῖνιξ*: see *phenix*.] **1.** A tree or shrub of the *Phœnicaceæ*. The palms form a natural plant-group of great interest, in appearance highly picturesque and often elegant, and in usefulness surpassed by no family except the grasses. The pulpy fruit of some species, most notably of the date, and the seed-kernel of others, preëminently the cocoanut, are edible. Oil is yielded by the fruit-pulp of some (oil-palm) and by the seeds of others (cocoanut, bacaba, etc.). The pith of the sago-palms is farinaceous, and the large terminal bud of the cabbage-palm serves as a vegetable, as do the young seedlings of the palmyra. The sap of the wild date-tree and other species yields palm-sugar or jaggery; that of the coquito, palm-honey. The juice of various species becomes toddy or palm-wine, which in fermenting serves as yeast, and distilled affords a spirituous liquor. Aside from food and drink, the betel-nut, a kind of catechu, and a kind of dragon's-blood are palm-products; a candle-wax exudes from *Ceroxylon;* vegetable ivory is the nut of the ivory-palm. Palm-wood is useful for building (date-palm, palmyra, etc.), for fine work (porcupine-wood), for piles (palmetto), and for flexible articles (ratan). The leaves of many species serve for thatching (bussu-palm, royal palmetto, palmyra, etc.), for making hats, baskets, and fans, and in place of paper (palmetto, talipot, etc.). The leafstalks of some (kittul, piassava) furnish an important fiber, as also does the husk of the cocoanut. There are many other uses. The cocoanut-, date-, and palmyra-palms lead in importance. The palm of the Bible is the date-palm. (For symbolic use, see def. 2.) As ornamental plants in temperate regions the palms are indispensable where sufficient hothouse room can be had.

2. A branch, properly a leaf, of the palm-tree, anciently borne or worn as a symbol of victory or triumph; hence, superiority; victory; triumph; honor; prize. The palm was adopted as an emblem of victory, it is said, because the tree is so elastic as, when pressed, to rise and recover its correct position. The Jews carried palm-branches on festal occasions, and the Roman Catholic and Greek churches have preserved this usage in celebrating the entry of Christ into Jerusalem. See *Palm Sunday*. See also def. 3.

3. One of several other plants, popularly so called as resembling in some way the palm, or, especially, as substituted for it in church usage. Among plants so designated are, in Great Britain, chiefly the great sallow or goat-willow, *Salix Caprea*, at the time when its catkins are out, and the common yew (the latter is universally so called in Ireland); in Europe also the olive, holly, box, and another willow; and in the northern United States the hemlock-spruce.

palmæ[1], *n.* Plural of *palma*.

Palmæ[2] (pal'mē), *n. pl.* [NL. (Linnæus, 1737), pl. of L. *palma*, a palm.] A family of monocotyledonous plants, the palms, characterized by the one- to three-celled free ovary, solitary ovules, and small embryo immersed in a little hollow near the outside of the hard or oily albumen. About 1,100 species are known, classed in 150 genera and 8 tribes. They are mainly tropical, especially American, and are most abundant on coasts and islands; fewer in Asia and Australia; fewest in Africa; reaching lat. 44° north in Europe, 36° in America, 34° in Asia. As the name is not based on that of any genus various other names have been proposed. *Arecaceæ* (from *Areca*), Reichenbach, 1828, is much in favor. But *Phœnix* is probably the most important genus, and *Phœnicaceæ* would seem to be a most appropriate name for the family. It was used by Philip Schimper in 1871, but only for the feather-palms, as he made three families, dividing the fan-palms into two, *Sabalaceæ* and *Borassaceæ*. In this he has not been followed. Many authors have used *Palmaceæ*, but this is open to the same objection as *Palmæ*. See *palm*[2], *date-palm, palmyra*, and cuts under *Corypha, piassava, nervation, cocoa*, and *Ceroxylon*.

The cells are surrounded with a thick integument, which is generally soon confluent into a shapeless mass of jelly; multiplication is mostly by division. The particular plants, however, to which they belong have never been determined.—**Palmella stage**, or **palmella condition**, a general phrase sometimes applied to certain of the lower algæ which exhibit the peculiar gelatinous masses described above. palmerin (pal′mėr-in), *n.* [< *Palmerin* (see def.).] One of a line of romantic heroes of the age of chivalry, who took their names or their titles from Palmerin de Oliva, an illegitimate grandson of a Greek emperor of Constantinople. This Palmerin derived his name from the circumstance of his exposure in a wicker basket on a mountain-side among palms and olive-trees in Spain. He afterward became famous for his exploits in Germany, England, and the Orient. The exploits of the Palmerins, as celebrated in the famous Spanish romances called by their name, are evidently modeled after those of Amadis of Gaul. In literature the name is often applied as a term of distinction to any redoubtable champion of the age of chivalry.

> That brave Rosicler
> That damned brood of ugly giants slew,
> And *Palmerin* Frannarco overthrew.
> *Beau. and Fl.*, Knight of Burning Pestle, iii. 2.

The oldest ballads tell us nothing at all . . . of the *Palmerins*, nor of many other well-known and famous heroes of the shadow-land of chivalry.

> *Ticknor*, Span. Lit., I. 119.

★**palmer-worm** (pä′mėr-wėrm), *n.* [< *palmer*[2] + *worm*.] 1. A caterpillar; especially, a hairy caterpillar injurious to vegetation, but what kind is unknown or undetermined. The name occurs three times in the Bible (Joel i. 4; ii. 25; Amos iv. 9) as the translation of the Hebrew *gāzām*, rendered in the Septuagint *κάμπη* and in the Vulgate *eruca*. Some have supposed it to be a destructive kind of locust, as *Pachytylus migratorius*; but in Joel the name is expressly distinguished from "locust." The Hebrew name is referred to a root meaning 'to cut off'; the Greek *κάμπη* refers to the bending or looping of some caterpillars, apparently pointing to a looper or measuring-worm—that is, the larva of some geometrid moth; and the Latin *eruca* may have the same significance. The destructiveness of many of these geometrids would fully bear out the Biblical implication. See *oubit*.

> There is another sort of these Catterpillers, who haue no certaine place of abode, nor yet cannot tell where te find theyr foode, but, like vnto superstitious Pilgrims, doo wander and stray hither and thither, (and like Mise) consume and eate vp that which is none of their owne; and these haue purchased a very apt name amongst vs Englishmen, to be called *Palmer-worms*, by reason of their wandering and rogish life (for they neuer stay in one place, but are euer wandering), although by reason of their roughnes and ruggednes some call them Beare-wormes. They can by no means endure to be dyeted, and to feede vpon some certaine herbes and flowers, but boldly and disorderly creepe ouer all, and tast of all plants and trees indifferently, and liue as they list.
> *Topsell*, History of Serpents (1608), p. 105.
>
> That which the *palmerworm* hath left hath the locust eaten. Joel i. 4.

2. In the United States, the larva of the tineid moth *Ypsilophus ligulellus*, which in eastern parts of the country appears on the leaves of the apple in June, draws them together, and skeletonizes them.

The labial palpi are two in number, rising either from the ligula or from the edge of the mentum; the maxillary palpi are placed one on the outer side of each maxilla. In the *Lepidoptera* this term is commonly restricted to the large labial palpi, the much smaller maxillary ones being distinguished as *palpuli*. The palpi are supposed by some to be organs of taste or touch. pangenesis (pan-jen′e-sis), *n.* [NL., < Gr. *πᾶς* (*παν-*), all, + *γένεσις*, production.] A provisional hypothesis advanced by Darwin to explain the phenomena of reproduction in organisms. It rests on the assumptions that the organic units (cells) of which an organism is composed differ from one another according to the function of the organ to which they belong; that they undergo multiplication by budding or proliferation, giving rise to minute gemmules, which are diffused to a greater or less extent throughout every part of each organism; that these gemmules possess the properties which the unit had when they were thrown off; and that when they are exposed to certain conditions they give rise to the same kind of cells from which they were derived. The name is also applied to the theory or doctrine that every organism has its origin in a simple cell called a *pangenetic cell*.

I venture to advance the hypothesis of *Pangenesis*, which implies that every separate part of the whole organisation reproduces itself. So that ovules, spermatozoa, and pollen-grains—the fertilized egg or seed, as well as buds—include and consist of a multitude of germs thrown off from each separate part or unit.

★**pantograph** (pan'tō-grȧf), *n.* [Also *pantagraph*; = F. *pantographe* = Sp. *pantógrafo* = Pg. *pantographo* = It. *pantografo*, < Gr. παῦς (παντ-), all, + γράφειν, write. Also, erroneously, *pentegraph*, as if < Gr. πέντε, five, + γράφειν, write.] An instrument for the mechanical copying of engravings, diagrams, plans, etc., either upon the same scale or upon a reduced or an enlarged scale. It consists of four perforated limbs or rules, *a*, *b*, *d*, *e*, of wood or metal, arranged in pairs, jointed together at the crossing, the two pairs being also

Pantograph.

a, *b*, *d*, and *e* are rules perforated with a series of holes placed at graduated distances for adjustment to different scales for enlargement or reduction of the picture to be transcribed; *a* and *b* are permanently but movably jointed at *c* to a traversing support; *d* and *e* are similarly jointed at *h* to a pencil-holder or point-holder; *f f* are thumbscrews which act as pivots for joining *a* and *d* and *b* and *e*. The rule *a* is pivoted to a support *i* which is fixed to the drawing-table; *g* is a stylus attached to the end of the rule *b*. Lines traced by *g* will be also drawn by *h* on a larger or smaller scale corresponding to the adjustment.

jointed together at *c* and *h*. The perforations are made at uniform distances, in accordance with a scale of measurement. The pivoted joints by which the two pairs are connected are constant, while the joints between the intersecting limbs of each pair may be shifted by inserting the joint-pins *f f* in different holes in each limb. By changing the pins the copy may be reproduced on any scale either larger or smaller than the original, or it may be kept of the same size, the proportion being indicated for convenience by figures on the limbs (not shown in the cut). In use, the end pivot *i* is fixed to the table, the pivot *c* sliding on the plane surface according to the impulse given to it. The pivot *g* carries a tracing-point which is passed over the original lines to be reproduced, and the pivot *h* carries a pencil or needle which traces the copy or pricks it in the paper. The pantograph is used for transferring patterns to calico-printing cylinders, in some processes of wood-carving, in making wooden type, etc.—**Polar pantograph**, a modification of the pantograph arranged for reproducing profiles of curved figures, as the tread of a car-wheel, the interior of a bell, or any other irregular form. It consists essentially of two arms supported in a light frame and united by means of a rack on each and a pinion common to both, so that the movement of one arm controls that of the other. When the point of the instrument is placed against the tread of a car-wheel, and is moved over it, the other arm reproduces a tracing that is an exact copy of the tread, showing such flattened places as may have resulted from wear, and such other irregularities as are present.

pantographic (pan-tō-graf'ik), *a.* [= F. *pantographique* = Pg. *pantographico*; as *pantograph* + *-ic*.] Of or pertaining to or produced by a pantograph. ★ **paper** (pā′pėr), *n.* and *a.* [< ME. *paper, papir, paupire* = D. *papier* = MLG. *pappīr, papīr* = late MHG. G. *papier* = Icel. *pappīr* = Sw. *papper* = Dan. *papir*, < OF. *papier*, F. *papier* = Sp. A material consisting of a compacted web or felting of vegetable fibers, commonly in the form of a thin, flexible sheet: used in writing, for printing, and for various other purposes. The fibers most used for writing-papers are those of linen and cotton rags, and for printing-papers those of straw, wood, paper-cuttings or paper-waste, and selected grasses. These fibers are prepared by grinding, bleaching, beating, and boiling until they are reduced to a fluid pulp, in which state they readily mat or felt together when freed from the water in which they are suspended. More than 400 varieties of fibers usable for this purpose are known; all have curling filaments that readily interlace with one another. Paper was formerly made wholly by hand, pulp from the vat being dipped up in a mold, from which the water drains away, leaving a felted sheet, which is then pressed and dried. Some fine grades of writing-, printing-, and drawing-papers are still made in this way, but the larger part of the paper, for whatever purpose used, is now made by machinery. For some purposes, as newspaper-printing, the sheet is made in continuous webs of very great length, and is printed from the uncut roll. Paper is made in a great variety of qualities, ranging from heavy drawing board to the lightest tissue paper, and in every color and shade. It is cut for the trade by accurate machines in a number of sizes, the sheets varying somewhat according to fashion or special requirements. (See list of sizes given below.) Paper is also molded from the pulp into cartridge-cases, embossed sheets for wall-decoration, pails, boxes, and other vessels, boats, barrels, car-wheels, domes for observatories, bricks, building materials, etc., in all of which lightness is combined with strength. From the sheet it is transformed by various processes and operations into roofing material, carpets, bags, etc. The principal varieties of ordinary paper are — writing- and printing-papers, coarse papers for wrapping and other purposes, and blotting- and filtering-papers; while some useful kinds are the result of manipulations subsequent to the paper-maker's work, as lithographic paper, tracing-paper, etc. The ordinary counts of paper are the quire of twenty-four sheets, the ream of twenty quires (of which two are inferior to the other eighteen), and the bundle of two reams.

[*l. c.*] A general name of all lepidopters before the introduction of the binomial nomenclature in zoölogy.—2. A notable genus of butterflies: a name variously used. (*a*) By Linnæus (1758), for all butterflies then known: equivalent to *Rhopalocera.* (*b*) By Fabricius (1793), for butterflies of

the families *Nymphalidæ* and *Papilionidæ.* (*c*) By Schrank (1801), for the *Nymphalidæ* alone. (*d*) By Latreille (1805), for the *Papilionidæ* alone. Westwood (1840) gives the European swallowtail, *P. machaon*, as the type species of the genus; Scudder (1872) decides that *P. antiopa* is the type. By most entomologists the name is now restricted to swallow-tailed butterflies having ample wings, triangular fore wings, hind wings concave next to the body and usually extended behind into a tail before the anal angle, and outer margin of hind wings dentate, with the teeth quite prominent near the tail. The genus thus defined is of world-wide distribution, with about 350 species. The common yellow and black butterfly of North America, *P. turnus*, is a good example. Another is the common swallow-tailed butterfly of Europe, *P. machaon*, with long antennæ, very short palpi, and the hind wings tailed. This species expands about three and one half inches, is yellow and black, with a red spot at the anal angle. Some of the papilios are giants, as *P. antimachus* of Africa, expanding about eight inches. See *Equites*, 2, and also cut under *Papilionidæ.*

(Leach, 1819), < *Papilio*(*n-*) + *-idæ.*] A family of butterflies, typified by the genus *Papilio*, usually considered the highest of the diurnal *Lepidoptera*, or *Rhopalocera.* They have broad wings erect in repose, the hind wings concave along the abdominal border, slender antennæ with the knob straight or scarcely curved, slender body, and six functional legs of which the first pair is of normal size and directed forward. The larvæ are smooth or only moderately pilose, never spinose, thicker in front, tapering behind, with two retractile tentacles on the segment behind the head. The chrysalids are naked, angular, fastened to a button of silk, and hung by a silken loop a little above the middle of the body. The *Papilionidæ* are generally called *swallow-tails*, and include many strikingly beautiful butterflies. [Other forms are *Papiliones* (Dalman, 1816); *Papilionida* (Leach, 1815); *Papilionidea* (Latreille, 1802); and *Papilionidi* (Boisduval, 1829).] See also cuts under *Papilio.*

See *pala*, 2.—**Circumvallate** or **calyciform papillæ.** See *circumvallate.* —**Conical** or **filiform papillæ**, minute conical, tapering, or cylindrical papillæ, densely set over the greater part of the dorsum of the tongue, and terminating usually in a tuft of simple papillæ, whose horny epithelial covering forms hair-like processes. These processes give the tongue its furred or velvety appearance. Also called *papillæ minimæ.* See cut under *tongue.*—**Engorged papilla.** See *engorge.*—**Foliate papillæ**, small folds of mucous membrane on the sides of the tongue, immediately in front of the anterior pillar of the palate.—**Fungiform papillæ**, papillæ intermediate in size and number between the circumvallate and the conical papillæ, scattered over the dorsum of the tongue, but more numerous along the sides and at the tip. The papyrus was prepared by cutting the central pith of the reed into longitudinal strips, which were laid side by side, with another layer of strips crossing them at right angles. The two layers, thus prepared, were soaked in water, then pressed together to make them adhere, and dried. For books the papyrus was formed into rolls by cementing together a number of sheets. In *banking* and *com.*, the state of the shares of any business, undertaking, loan, etc., when they are neither at a discount nor at a premium—that is, when they may be purchased at the original price (called *issue par*), or at their face-value (called *nominal par*). The *par* is a certain number of pieces of the coin of one country, containing in them an equal quantity of silver to that in another number of pieces of the coin of another country: e. g. supposing 36 skillings of Holland to have just as much silver in them as 20 English shillings.
Locke, Farther Considerations on Money.

Above par, at a premium.—**Arbitrated par, arbitrated par of exchange**, the amount in the currency of one country which is equivalent at any time to a given amount of a foreign currency. The arbitrated par represents the mint par as modified by the transient influences of supply and demand and other circumstances of the time and of the particular transaction.—**Below par**, at a discount.—**Issue par**, the price at which a stock or other value is issued to the public, sometimes less than the nominal par. Thus, if bonds nominally for $100 each are issued at $85, the latter is called the *issue par*.—**Mint par, mint par of exchange**, the weight of pure gold or silver in a coin of one country as compared with that in a coin of the same metal of another country.—**Nominal par**, the face-value of a share of stock, etc.—**Par of exchange**, the established value of the coin or standard value of one country expressed in the coin or standard value of another. In stating this par of exchange the standard of value of one country may be regarded as fixed, and that of the other variable. Thus, in exchange between the United States and Great Britain, the United States gold dollar may be taken as equal to so many shillings and pence sterling, or, as is more usual, the pound sterling is fixed, and equal to so many dollars and cents United States gold, viz. $4.84.

Skt. *parā*, away, *param*, beyond; L. *per*, through, Oscan *perum*, without; AS. and E. *for-*, *fore-*, etc.: see *for-*, *fore-*, *per-*, etc.] A prefix of Greek origin, meaning 'from beside,' 'beside,' 'near,' 'by,' etc. See etymology. It often denotes correspondence of parts. It is used in the formation of new scientific terms, but is not regarded as an established formative in English. In *chemistry* the prefix signifies close relation, as in *paraldehyde*, a polymer of aldehyde, or that a compound is formed from benzene by substituting other elements or radicals for two hydrogen atoms in the benzene ring, and that these atoms have an opposite position in the ring. (See *ortho-* and *meta-*.) In *biology* it indicates comparison with something else, yet a distinctness or difference therefrom in one of many or various ways. In *pathology* it signifies a condition differing in quality from normal.

parabasis (pa-rab'ā-sis), *n.* [NL., < Gr. παράβασις (as def.), < παρά, beside, + βάσις, a stepping, step, < βαίνειν, walk, step.] The chief of the choral parts in ancient Greek comedy. It was sung by the chorus, usually divided into four rows of six and moving backward and forward facing the audience, during an intermission in the action, and while the actors were off the stage. It was written for the most part in anapestic tetrameters, and consisted, in fact, of an address from the poet to the public, giving his views and advice on affairs of state, as well as, often, his personal interests and claims for recognition or reward. The parabasis was regularly divided into six rhetorical parts, which were again subdivided; but any of these parts might be omitted or modified. It continued in the fully developed comedy the tradition of the Bacchic processions in which Greek comedy had its origin.

Something similar in purpose to the *parabasis* was essayed in one, at least, of the comedies of Beaumont and Fletcher, and in our time by Tieck.
Lowell, Study Windows, p. 218.

The distinctive feature of Old, as compared with Middle Comedy, is the *parabasis*, the speech in which the chorus, moving towards and facing the audience, addressed it in the name of the poet, often abandoning all reference to the action of the play. *Encyc. Brit.*, VII. 407.

Poesie, p. 205.

★**parabola**[2] (pa-rab′ō-lȧ), *n.* [= F. *parabole* = Sp. *parábola* = Pg. It. *parabola*, < NL. *parabola*, a parabola, < Gr. *παραβολή*, a parabola (see def.), so called by Apollonius of Perga, lit. 'superposition,' < *παραβάλλειν*, throw beside, compare: see *parable*[1].] 1. A curve commonly defined as the intersection of a cone with a plane parallel with its side. The name is derived from the following property. Let the figure represent the cone. Let ABG be the triangle through the axis of the cone. Let DE be a line perpendicular to this triangle, cutting BG in H. Let the cone be cut by a plane through DE parallel to AG, so that the intersection with the cone will be the curve called the parabola. Let Z be the point where this curve cuts AB. Then the line ZH is called by Apollonius the diameter of the parabola, or the principal diameter, or the diameter from generation; it is now called the axis. From Z draw ZT at right angles to ZH and in the plane of ZH and AB, of such a length as to make ZT : ZA :: BG² : AB.AG. This line ZT is called the latus rectum; it is now also called the parameter. Now take any point whatever, as K, on the curve. From it draw KL parallel to DE, meeting the diameter in L. ZL is called the abscissa. If now, on ZL as a base, we erect a rectangle equal in area to the square on KL, the other side of this rectangle may be precisely superposed upon the latus rectum, ZT. This property constitutes the best practical definition of the parabola. If a similar construction were made in the case of the ellipse, the side of the rectangle would fall short of the latus rectum; in the case of the hyperbola, would surpass it. The modern scientific definition of the parabola is that it is that plane curve of the second order which is tangent to the line at infinity. The parabola is also frequently defined as the curve which is everywhere equally distant from a fixed point called its focus, and from a fixed line called its directrix. The normal to a parabola at every point on the curve bisects the angle between the line parallel to the axis and the line to the focus. See also cuts under *conic*.

Common Parabola, with focus *F* and directrix *AB*.

2. By extension, any algebraical curve, or branch of a curve, having the line at infinity as a real tangent. Such a curve runs off to infinity without approximating to an asymptote. See *trident*.—**Cubical** or **cubic parabola**, a parabola of the third order—that is, such that every line in the plane meets it in three points, one at least real, though it may be at infinity; especially, the curve better described as the *central cubical parabola*, which has a cusp on the line at infinity, and the normal at its inflection passing through the cusp. There is also a non-plane curve so called.—**Cuspidate parabola**, a parabola having a cusp.—**Divergent parabola**, a plane curve having the line at infinity as an inflectional tangent.—**Double parabola**, a plane curve of the third class, having the line at infinity for a double tangent.—**Helicoid parabola.** See *helicoid*.—**Neilian parabola**, the semicubical parabola, which was rectified, before any other curve, by Wm. Neil in 1657.—**Nodate parabola**, a parabola having a crunode.—**Oval parabola**, a parabola having an oval.—**Plane cubic parabola.** See *cubic*.—**Punctate parabola**, a parabola having an acnode.—**Semicubical parabola**, the cuspidal cubical parabola, otherwise called the *Neilian parabola*.

Thomas Digrey and John Dey, gentlemen and mathematicians amongst us, have learnedly proved by *parallactic* doctrine that it [a new star in Cassiopeia] was in the celestiall, not in the elementary region.
Holland, tr. of Camden (Elizabeth, an. 1572).

(*b*) The angle between the vertical circle and the declination circle of a star.—**Parallactic ellipse**, the ellipse which a star appears to describe annually in consequence of the earth's revolution around the sun, and by virtue of parallax.—**Parallactic inequality**, an inequality in the moon's motion dependent upon the solar parallax at the moon. Its period is one synodical revolution, or 29.53 days, being double that of the variation, which it thus alternately increases and diminishes. An apparent displacement of an object observed, due to real displacement of the observer, so that the direction of the former with reference to the latter is changed. In the cut, the angle BCD, being the semidiameter of AB as seen from C, is the parallax of C as seen from B. In astronomy, parallax is due either to our daily motion round the center of the earth, or to our yearly motion round the sun. Parallax is observed, also, when the head is moved before two images or other objects in the region of distinct vision and at unequal distances. There is also an effect of parallax when we alternately shut one eye and open the other.

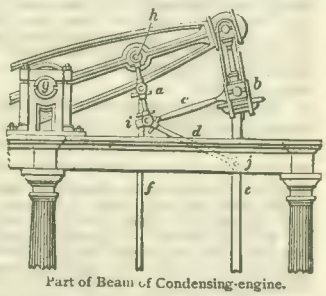
Parallax.

2. In *optics*, an apparent shifting of the spider-lines in a telescope-reticle as the eye is moved before the eyepiece: it is due to the non-coincidence of the threads with the focal plane of the object-glass.—**Angle of parallax**, in *physiological optics*, the angle which the visual axes form at their point of meeting. This angle becomes greater the nearer the point of fixation.—**Annual parallax**, the displacement of a star owing to its being observed from the earth instead of from the sun.—**Diurnal parallax**, the displacement of a body owing to its being observed from the surface instead of from the center of the earth.—**Horizontal parallax**, the diurnal parallax of a heavenly body upon the horizon. The horizontal parallax is equal to the semi-diameter of the earth as seen from the heavenly body.—**Parallax of altitude**, the angular amount by which the altitude of the moon or other heavenly body is less on account of parallax.

★**parallel** (par′a-lel), *a.* and *n.* [< OF. *parallele*, F. *parallèle* = Sp. *paralelo* = Pg. *parallelo* = It. *parallelo*, *paralello*, < L. *parallelus*, *parallelos*, < Gr. *παράλληλος*, beside one another, < *παρά*, beside, + *ἀλλήλων*, gen., etc. (found only in oblique cases of dual and plural), one another, a reduplicated form, < *ἄλλος*, another, + *ἄλλος*, another.] **I.** *a.* 1. In *geom.*, of lines (according to Euclid in his definition of parallel straight lines), lying in the same plane but never meeting however far they may be produced both ways; of planes, never meeting however far they may be produced; in modern geometry, intersecting at infinity. The definition of Euclid is the traditional one; but the modern definition has three logical advantages: first, it is not, like the Euclidean definition, a negative one; second, it makes one conception applicable equally to parallel lines and parallel planes; and third, it is a statement which, whether literally true or not, must be admitted in form for the sake of the important generalizations which result from it.

Parallel Lines.
Two lines in a plane cut by a third, making the sum of the internal angles on one side two right angles.

2. Having the same direction, tendency, or course.



How am I then a villain
To counsel Cassio to this *parallel* course,

Stillingfleet, Sermons, I. iv.

4. In *music*: (*a*) Of two voice-parts, progressing so that the interval between them remains the same. Such progression is called *parallel motion*, and the intervals by which the two parts are separated are called *parallel intervals*. When the interval is a unison, an octave, or a perfect fifth, the progression is regarded as faulty: such progressions are called *parallel unisons*, *octaves*, or *fifths*, or simply *parallels* or *consecutives*. Parallel thirds and sixths are correct, and pleasing when not too long continued. Parallel seconds and sevenths are rare, and usually objectionable. (*b*) Of tonalities, same as *relative*.—5. (*b*) *Milit.,* same as *parallels.* See II., 5.—**Parallel motion.** (*a*) Linkwork by which the end of a piston-rod is caused to move in a straight line in spite of deflecting effort. The ordinary parallel motion, that of Watt, fulfils its function to a close degree of approximation, but not exactly. It is designed to cause the piston-rod in imparting motion to, and the pump-rod in taking motion from, the oscillating beam of a steam-engine, to move respectively in very nearly right lines, and is sufficiently perfect for all practical purposes. It depends upon the principle that when the ends of two levers connected by a link oscillate on different centers in the same vertical plane, describing arcs convex toward each other, there is some point in the connecting-link that must move in nearly a right line. The position of this point depends upon the lengths of the levers and the relative positions of their fulcrums. A method for mathematically locating this point has been given by Rankine. In the diagram the ends of the equal levers *g h* and *i j* describe arcs convex toward each other; *a* is the connecting-link *g* and *j* are the fulcrums. The piston-rod is connected at *b* to the link *c;* and when the levers are caused to oscillate, one end of the link *a* is drawn to the right, while the other is moved to the left, causing the point of connection, and also the pump-rod *f* and piston-rod *e,* to move in nearly right lines. The first exact parallel motion discovered, after immense labor by many mathematicians, was Peaucellier's cell. (See *cell.*) The simplest is the Kempe-Sylvester parallel motion. (*b*) In *music.* See *motion.*—**Parallel perspective, rod,** etc. See the nouns.—**Parallel roads,** benches or terraces on hill-slopes, indicating former levels at which the water stood in the valley beneath at a time when this was occupied by a lake, or a lake-like expansion of a river. The phrase *parallel roads* is chiefly used with reference to the so-called Parallel Roads of Glenroy in Scotland, in regard to which there has been much discussion among geologists. See *terrace.*—**Parallel rulers,** an instrument for plotting courses on a chart, or for drawing parallel lines for other purposes. It consists of two rulers connected by cross-bars of equal length, movable about joints, so that while the distance between the two rulers may be increased or diminished, their edges always remain parallel.—**Parallel sailing, sphere,** etc. See the nouns.—**Parallel sulcus.** See *parallel fissure.*

The connection is *in series* when the positive pole of one cell or machine is joined to the negative of the next.—**Mundane parallel,** in *astrol.,* situation at equal distances from the meridian.—**Parallels of altitude,** in *astron.,* small circles of the sphere parallel to the horizon. Also called *almucantars.*—**Parallels of declination,** small circles of the celestial sphere parallel to the equator.—**Theory of parallels,** the geometrical discussion of the number of lines which can be drawn through a given point parallel to a given line, with other kindred matters. The fifth postulate (in some modern editions the eleventh axiom) of Euclid reads, "And if a right line incident upon two right lines make the two interior angles on the same side less in sum than two right angles, then those two right lines will meet on the side on which the angles are less than two right angles if produced indefinitely." This proposition being much more complicated than any other assumed by Euclid without proof, a great number of attempts were made by mathematicians to demonstrate it. Finally, it was conclusively shown that we have no reason to believe that the celebrated postulate is more than approximately true. There are thus three possible systems of geometry, the Euclidean and two non-Euclidean systems, according as it is assumed that there can be drawn through any given point, parallel to any given line, only one line, two real lines, or none.—**Zodiacal parallel,** in *astrol.,* the situation of two planets at the same distance from the equator.

> *B. Jonson*, Volpone, v. 4.

Specifically—2. (*a*) In *zoöl.*, an animal that lives in or on and at the expense of another animal called technically the *host;* also, by extension, an animal which lives on or with, but not at the expense of, its host: in the latter sense, more precisely designated *inquiline* or *commensal* (see these words). There is scarcely any animal that may not or does not serve as the host of parasites, and some parasites are themselves the hosts of other parasites. (See *hyperparasite.*) Parasites form no technical group of animals, since representatives of almost any class or order, from protozoans to vertebrates, may be parasitic. Most of the leading divisions of animals, however, include some members, whether genera, families, orders, or even classes, whose habit is extensively or exclusively parasitic. Thus, among protozoans, the *Gregarinida* are parasites. Among worms many families, some orders, or even classes, are entirely parasitic, furnishing the most formidable and frequent parasites of man and domestic animals. Very many of the lower crustaceans are parasites, especially upon fishes, mollusks, etc., and upon one another; while some of the highest crustaceans are modified parasites, or commensals, as the little crabs that live in oyster-shells. Among arachnidans, the whole class or order of acarids or mites is essentially parasitic, though including many forms which lead an independent life. Insects furnish many of the parasites, especially of terrestrial animals, as vertebrates, and some are parasites of other insects. One order of insects, the *Anoplura* or lice, is thoroughly parasitic, and other orders furnish parasitic families or genera. Insects and crustaceans both belong to the phylum *Arthropoda*, and it may be said that as a rule insects furnish the arthropod parasites of land-animals, and crustaceans those of water-animals, or terrestrial and aquatic "lice" respectively. Few mollusks are parasitic, but *Entoconcha mirabilis*, a gastropod found in holothurians, is an example. Very few vertebrates are parasites, but hags (*Myxine*) bore into fishes, fishes of the genus *Fierasfer* crawl into the intestines of holothurians, and some other fishes exhibit a kind of parasitism. Parasites not constituting any natural division of animals, it follows that, as such, they are not naturally divisible into zoölogical groups. They are, however, conveniently called *entoparasites* or *ectoparasites*, according as they live in or on their hosts, or *Entozoa* and *Epizoa*, upon the same grounds. According to the extent or degree of their parasitism, they are also known as *parasites proper* and *commensals* or *inquilines* (see above). Among the most remarkable parasites are the males of some species which have their own females as hosts, as among cirripeds. Such males are known as *complemental males*, one or more of which are carried about by the female in her vulva, they being of insignificant size and to all intents and purposes mere male parts of her. The above-mentioned parasites are exclusive of all those many animals which are parasitic upon plants, as gall-insects and the like; and also of those birds which are parasitic to the extent of laying their eggs in other birds' nests, requiring their progeny to be hatched and brought up by foster-parents, as cuckoos and cowbirds. See cuts under *Cecrops*, *Entoniscus*, *Epizoa*, *Platypsylla*, and *Stylops.* (*b*) Particularly, an insect which lives either upon or within another insect during its earlier stages, eating and usually destroying its host. Such parasites belong mainly to the *Hymenoptera* and to the *Diptera*, but there are a few coleopters and lepidopters to which the name may be applied. See cut under *Antigaster.* (*c*) In *bot.*, a plant which grows upon another plant or upon an animal, and feeds upon its juices. See *parasitic*, and cut under *Cercospora.*

> Fungi have long been divided into two main sections founded on their nutritive adaptation. Those which constitute the first category feed on living organisms, whether plants or animals, and are termed *parasites.*
> *De Bary*, Fungi (trans.), p. 356.

3. In *teratol.* See *autosite.*—**Autœcious parasite**, in *bot.*, an organism which goes through the whole course of its development on a single host.—**Autoxenous parasite**, in *bot.*, same as *autœcious parasite.*—**Facultative parasite.** See *facultative.*—**Heterœcious parasite**, in *bot.*, same as *metœcious parasite.*—**Metœcious parasite**, in *bot.*, an organism which passes through the different stages of its development on widely different hosts, as some of the *Uredinales.*—**Metoxenous parasite**, in *bot.*, same as *metœcious parasite.*—**Obligate parasite**, in *bot.*, an organism to which a parasitic life is indispensable for the full attainment of its development.=Syn. 1. *Parasite*, *Sycophant.* The object of the *sycophant* is to ingratiate himself with one who is wealthy or powerful, and his means are especially servility and flattery. The *parasite* gets a maintenance or a more comfortable maintenance by living upon one who is richer; there is no suggestion as to the means employed, but the word is contemptuous as implying a relation of degradation. The derivational idea of *sycophant* is now quite lost; the secondary use of *parasite* in connection with plant and animal life now affects the original sense of the relation of human beings.

★ **parasitic** (par-a-sit'ik), *a.* [= F. *parasitique* = Sp. Pg. *parasitico* = It. *parassitico*, < L. *parasiticus*, < Gr. παρασιτικός, parasitic, < παράσιτος, a parasite: see *parasite.*] 1. Of the nature of a parasite; fawning for bread or favors; meanly dependent; acting the sycophant; like a parasite in any way; of things, secondary; subordinated to or arising from another thing of the same kind.

Thus, members of the genus *Epeolus* (of which *E. mercatus* is an example) live in the nests of *Colletes;* of *Cœlioxys*, in the cells of *Megachile;* of *Melecta*, in the cells of *Anthophora;* and of *Stelis*, with *Osmia.*—**Parasitic birds**, those birds which lay their eggs in the nests of other birds, as the Old World cuckoos and the New World cowbirds.—**Parasitic currents.** Same as *Foucault currents.*

Electric Rev. (Eng.), XXVI. 118.

Parasitic plants, those plants which grow upon the living parts of other plants, from whose juices they derive their nutriment, a circumstance by which they are immediately distinguished from *false parasites*, or *epiphytes*, which merely fix or support themselves upon other plants without deriving food from them. The mistletoe is a familiar example of a true parasite. Parasitic plants are very numerous, and belong to various divisions of the vegetable kingdom. See parasitism of fungi upon algæ, under *Lichenes;* of fungi upon phanerogams, under *host*[2], and *heteræcism*. New York Med. Jour., XL. 454.

★ **II.** *a.* Parasiticidal; destructive to parasites.

parasitism (par'ạ-sī-tizm), *n.* [= F. *parasitisme* = Pg. *parasitismo;* as *parasite* + *-ism*.] **1.** A habitual living on or at the expense of another; parasitic condition, tendency, or habits; a state of dependency on the favor or good offices of another.

Specifically—**2.** In *zoöl.* and *bot.*, the vital relation which a parasite bears to its host; parasitic infestation. It is a remarkable fact in biology that parasitism infallibly entails retrograde metamorphosis, degeneration, or degradation of the type of structure which would be normal to the organism were it not parasitic. Thus, parasitic members of groups of insects which are normally winged lose their wings and suffer other modifications of structure. Among crustaceans parasitism results in the most grotesque shapes imaginable—mere caricatures, as it were. Mouth-parts, limbs, and other appendages are usually reduced to mere suckers, hooks, or other devices for holding to the host, or even to processes like rootlets of plants, deeply penetrating the substance of the host. In many parasites of comparatively high organization, as tapeworms, there is no proper digestive system, nor any alimentary canal, the creature being nourished by soaking in the juices of its host. Hence, morphological characters resulting from parasitic adaptation are essentially degradational, or vestigial, although they have practically much the same classificatory or taxonomic significance which attaches to a corresponding amount of morphological difference in organisms which lead independent existences.

parasitize (par'ạ-sī-tīz), *v. t.*; pret. and pp. *parasitized*, ppr. *parasitizing*. [< *parasite* + *-ize*.] In *zoöl.*, to infest or make a host of (another animal), as a parasite.

Gr. παράτονος, stretched out beside or along, < παρατείνειν, stretch out beside or along, produce, < παρά, beside, + τείνειν, stretch.] Arresting or retarding plant movement or growth: a term proposed by Sachs, in 1865, to characterize the variations in intensity of light which produce the movements of waking and sleeping (nyctitropism) in plants, in contradistinction to heliotropism. It is the increasing intensity of light in the morning which induces the waking of the leaves, and the decreasing intensity in the evening which induces the closing or nocturnal position of the leaves, whereas in the heliotropic curving of motile organs it is the constant influence of light which effects the turning. As employed by other vegetable physiologists, the word implies also the retarding influence of light upon growing organs, in distinction from the *phototonic* or stimulating effect upon leaves. That is, in leaves exposed for a protracted period to darkness the growth is arrested, but they have the power of growth restored on exposure to light, whereas all growing organs grow more rapidly in darkness than in light, this effect of light in retarding growth being termed the *paratonic effect.*

The power of movement, whether spontaneous or *paratonic*, may be temporarily suspended by certain external conditions. *Bessey*, Botany, p. 198.

As any man has power to wrong me.

Dispute betwixt myself and mine.
Tennyson, Princess, i.

=**Syn.** *Pardon, Forgive*. These words are often synonymous. Strictly, *pardon* expresses the act of an official or a superior, remitting all or the remainder of the punishment that belongs to an offense: as, the queen or the governor *pardons* a convict before the expiration of his sentence. *Forgive* refers especially to the feelings; it means that one not only resolves to overlook the offense and re-establishes amicable relations with the offender, but gives up all ill feeling against him. See *pardon, n.*

pardon (pär'dọn or -dn), *n.* [< ME. *pardon, pardoun, pardun*, < OF. *pardon, pardun*, F. *pardon* = Sp. *perdón* = Pg. *perdão* = It. *perdono*, < ML. *perdonum*, indulgence, pardon; from the verb.] 1. 2. In *law*, a free remission of the legal consequences of guilt or of some part of them; an act of grace proceeding from the power charged with the execution of the laws, which exempts the individual on whom it is bestowed from the punishment the law prescribes for a crime he has committed. *Marshall.* Mere mitigation of punishment is not pardon. *Pardon* is sometimes used in the more general sense which includes *amnesty*. In Great Britain the pardoning of offenses against the crown or the people rests with the crown, except in certain specified cases. Pardon is granted under the great seal or by warrant under the sign manual, countersigned by one of the principal secretaries of state, or by act of Parliament. Offenders against the laws of the United States may be pardoned by the President, except in cases of impeachment. In nearly all the States, persons convicted of crimes under the State laws, except in cases of treason and impeachment, may be pardoned by the governor, the governor and council, or the governor and board of pardons.

John Hunne had his *Pardon*, and Southwel died the Night before he should have been executed.
Baker, Chronicles, p. 187.

To beg, crave, or **ask one's pardon,** to ask one's forgiveness: a phrase corresponding in use to *pardon me* (which see, under *pardon, v.*).=**Syn.** *Pardon, Absolution, Remission, Amnesty*. All these words represent a complete work with reference to the offense, so that it becomes as though it had not been committed. *Pardon* is the general word (see comparison under *pardon, v. t.*). *Absolution* is now strictly an ecclesiastical word, as defined. *Remission* is, by derivation, a letting go, a sending away; "*remission* of sins" is a frequent Biblical expression; outside of Biblical language, we speak chiefly of the *remission* of penalty: as, the *remission* of a fine or of part of a term of imprisonment. *Amnesty* is strictly a political word, as defined, covering a general pardon of persons, named or unnamed, who have become exposed to penalty by offenses against the state or the sovereign. We speak of *pardon* of the offense or the person; *absolution* of the person from the offense; *remission* of sin or of penalty for the person; *amnesty* to all concerned in the insurrection.

Such persons would be within the general pardoning power, and also the special provision for *pardon* and *amnesty* contained in this act. *Lincoln*, in Raymond, p. 202.

It is the soft thin-walled tissue, with approximately isodiametric cells, which composes the soft pulp of leaves between the network of veins, the pulp of fruits, etc. In a dicotyledonous stem it forms the outer bark, the pith, and the medullary rays; in monocotyledons it is the common mass, of loose texture, through which the definite fibrovascular bundles are distributed. While the ordinary or typical shape of the cells is polyhedral or spheroidal, there are numerous modifications, all of which formerly received special designations, but only a few principal types are now distinguished by names. Spongy parenchyma is tissue in which the cells are loosely aggregated and have large intercellular spaces. Elongated parenchyma-cells are more compactly combined than short ones, and in the upper side of leaves have received the significant name of *palisade-cells*. Flattened parenchyma-cells are seen in the medullary rays of dicotyledons. Collenchyma, sclerotic and suberous parenchyma, trichomes, etc. are further modifications. Cf. *paraselene*.] An intensification of a circular space in a solar halo, generally in prismatic colors, sometimes dazzlingly bright. The phenomenon, on account of its rough resemblance to the sun itself, is popularly called a *mock sun*. Two or more parhelia are seen at the same time; and variously arranged white circles, arcs, and bands intersect the halo, or lie tangent to it at the same points. Halos are produced by the refraction of rays through suspended ice-crystals which tend to fall in one or more special positions, and parhelia are due to the excess of crystals so situated. When the sun is near the horizon and the ice-prisms in a vertical position largely preponderate, parhelia are formed on the halo both to the right and left of the sun, and at the same level. As the sun rises, the parhelia gradually separate outward from the halo. If there is an excess of hexagonal prisms with their axes horizontal, and if the axes of the prisms are perpendicular to the line joining the sun and the observer, parhelia will be produced which will be situated on the halo above and below the sun.

(*b*) Now, also, a civil division of the country for purposes of local self-government, such as the legal care of the poor, education, the regulation of sanitary matters, etc.: it is in general conterminous with the ecclesiastical parish. At present there are in England and Wales about 13,000 ecclesiastical parishes, and about 15,000 civil parishes, of which not more than 10,000 coincide with the ecclesiastical districts bearing the same name. In Scotland in 1888 there were 934 civil parishes or parishes proper (*quoad omnia*) and 386 parishes *quoad sacra* (that is, parishes in respect of things ecclesiastical only). There are several other minor classes of parishes, as the land-tax and Burial Act parishes in England, and the burghal and extra-burghal parishes in Scotland.

In the Protestant Episcopal Church the original form of the parish is more or less clearly adhered to, each diocese being as a rule divided into geographical parishes, and no new parish being formed or church established in cities without the consent of the three nearest parishes or congregations. (*d*) An ecclesiastical society, not bounded by territorial limits, nor confined in its personnel to communicants, but composed of all those who choose to unite in maintaining Christian work and worship in a particular local church: used in this sense chiefly in New England.

Specifically — **3.** [*cap.*] The supreme legislative body of the United Kingdom of Great Britain and Ireland, consisting of the three estates of the realm, namely the lords spiritual, the lords temporal, and the commons; the general council of the nation, constituting the legislature, summoned by the sovereign's authority to consult on the affairs of the nation and to enact and repeal laws. Primarily, the sovereign may be considered as a constituent element of Parliament; but the word as generally used has exclusive reference to the three estates above named, ranged in two distinct branches, the House of Lords and the House of Commons. The House of Lords includes the lords spiritual and lords temporal. (See *House of Lords*, under *lord.*) The House of Commons consists of 670 members: viz., for England and Wales, 253 representatives of county constituencies (counties or divisions of counties), 237 of boroughs, and 8 of universities; for Scotland, 39 representatives of counties, 31 of burghs, and 2 of universities; for Ireland, 85 representatives of counties, 16 of boroughs, and 2 of a university. The authority of Parliament extends over the United Kingdom and all its colonies and foreign possessions. The duration of a Parliament was fixed by the Septennial Act of 1716 at seven years, but it seldom even approaches its limit. Sessions are held annually, usually from about the middle of February to the end of August, and are closed by prorogation. Government is administered by the ministry (see *ministry* and *cabinet*), which is sustained by a majority in the House of Commons. Should the ministry be outvoted in the house on a question of vital importance, it either resigns office or dissolves Parliament and appeals to the country. The precursors of the Parliament were the Witenagemot in the Anglo-Saxon period and the National Council in the Norman and Angevin periods. The composition and powers of Parliament were developed in the thirteenth and fourteenth centuries; the right of representation from shires and towns dates from 1295, and the separation of the two houses dates from the middle of the fourteenth century. Parliamentary government was in large measure suspended from 1461 to the middle of the reign of Henry VIII. Prolonged struggles between the Parliament and the crown took place under James I. and Charles I., which led to the Civil War and the Commonwealth. The Triennial Act of 1694 (modified by the Septennial Act of 1716) fixed the life of Parliament at three years, and government by party dates from the same period. The right of election to Parliament has been greatly modified by the Reform Acts of 1832, 1867, and 1884, and the Redistribution Act of 1885.

I find that you have made choice of me to be one of your Burgesses for this now approaching *Parliament*. *Howell*, Letters, I. v. 4.

4. [*cap.*] One of similar legislative bodies constituting the legislatures of the Dominion of Canada, the Commonwealth of Australia, and other self-governing colonies of the British empire. The Parliament of the Dominion of Canada, established by royal proclamation in 1867, consists of two houses — a Senate, or upper house, whose members, 87 in number, are nominated for life by the governor-general, and a House of Commons, whose members are elected for

five years by the people of the different provinces, there being one representative for every 25,367 of the population. In the other colonies the two houses are usually styled the *Legislative Council* and the *Legislative Assembly*. The members of the latter body are elected; the members of the former body may be elected, as in Tasmania, or nominated by the crown, as in New South Wales.

In later times, the phrase is more commonly used of either house, or both houses, acting in the exercise of judicial or quasi-judicial functions, such as the inquest by the Commons and the trial by the Lords of an impeachment, or the action of either house, or both successively, on a bill of attainder, a question of contempt, the removal and punishment of public officers, etc., as distinguished from functions of legislation and functions as council of the king.

Any bird of the family *Psittacidæ* or order *Psittaci*; a zygodactyl scansorial bird with a cered and hooked bill. *Parrot* is the general name of all such birds, various kinds of them being called *cockatoos*, *macaws*, *parrakeets*, *lories*, and by many other

more specific names. When used in a stricter sense, it usually refers to Old World birds of moderate or rather large size, of stout build, with strong beak, fleshy tongue, and short square tail, as in the restricted genus *Psittacus*, of which the African *P. erythacus*, of a gray color with a bright-red tail, is a characteristic example and one of the commonest of cage-birds. The natural cries of parrots are, as a rule, extremely loud and harsh; but many of the fleshy-tongued species can be taught to articulate words and even sentences in a perfectly intelligible manner. Most parrots are expert climbers, and in scrambling about use the bill as well as the feet, the upper mandible being peculiarly movable. The tongue in some species is also used as an organ of touch, almost of prehension, objects being often held and handled between the tip of the tongue and the hook of the beak. These birds are mostly vegetarian, feeding upon seeds and especially soft fruits, but some are carnivorous. Their temper is uncertain, though several kinds exhibit the most affectionate and gentle disposition, at least toward one another. In size and shape parrots differ greatly, more than is usual among the representatives of any one family of birds: some of the smallest species are no larger than sparrows, as those of the genus *Nasiterna*, while the great macaws attain a length of about three feet. Their coloration is equally diversified: some are black or gray; some are snowy-white; green is the most characteristic color; yellow, red, and blue, often of the most brilliant tone, are very common; and many parrots are variegated with all these colors. The sexes are usually colored alike. Gaudiness of coloration reaches its extreme in the macaws, while the most beautiful and dainty tinting is common among the lories, and plain or somber shades are exceptional throughout the order. Of parrots of all kinds there are about 350 species, classed in from 25 to 100 genera according to the views of different ornithologists. They abound in all tropical countries, but seldom extend into temperate countries, except Australia and New Zealand. In round numbers, the geographical distribution of parrots is as follows: America is richest in species, having 150, only one of which occurs in the United States, though two or three others come nearly or quite to the Mexican border; the Moluccas and Papuan islands have 80 species, Australia 60, and Polynesia 30; 25 are African; and 20 are peculiar to Asia. See also cuts under *cockatoo*, *Conurus*, *corella*, *Euphema*, *macaw*, *Melopsittacus*, and *parrakeet*.

2. In *gram.*, a verbal adjective that participates or shares in the construction of the verb to which it belongs, and so has in a certain manner and degree a place in the verbal system; a word having the value of an adjective as part of speech, but so regularly made from a verb, and associated with it in meaning and construction, as to seem to belong to the verb. Thus, '*giving* him a book,' like 'I give him a book'; 'the book *given* him,' or '*lent* him,' or '*handed* him'; and so on. There are but two simple participles in English, usually called the *present* and the *past* or *passive*: as, *loving, loved; singing, sung*; in some languages there are more, as for example in Greek. The division-line between participle and ordinary adjective is indistinct, and the one often passes over into the other: thus, a *charming* girl, a *learned* man. Participles are much used in many languages, especially in English, in forming verb-phrases by combination with auxiliaries: thus, I am *giving*, I have *given*, it is *given*, etc.

Specifically—**2.** In *law*, the relation subsisting between persons who by oral or written contract unite services or property or both in a business enterprise for mutual benefit. It involves usually a reciprocal agency and a community of profits and of losses, and often a community of interest in the capital. Since one in such a relation may make himself liable as a partner to pay debts, and yet fail to secure the right to share assets, the test of what constitutes a partner varies according as merely the relation of the parties to one another is considered, or their relation to third persons dealing with the firm. For the purpose of liability to third persons, a right to share in the profits as profits, as distinguished from receiving a compensation in proportion to profits, has been deemed the general test; but it is subject to exceptions and qualifications, and in England and some other jurisdictions the test is whether the relation was such that the one sought to be held liable had constituted the other his agent to contract such obligation. Where one allows himself to be represented as a responsible partner he is liable.

3. The contract creating the relation of partners.—**4.** A rule in arithmetic. See *fellowship*, 4.—**General partnership**, a partnership in which the relation is not qualified as *limited* or *special*, and in which, therefore, all the members are jointly liable for all the debts.—**Limited partnership, or special partnership**, a partnership in which the special partner contributes to the common stock a specific sum in cash, and is liable for the debts of the partnership only to the amount of his investment. This immunity is secured by compliance with the statutes creating it, which usually provide that the special partner shall take no part in the conduct of the business.—**Mining partnership**, a partnership which exists when two or more persons, who own or acquire a mining-claim for the purpose of working it and extracting the mineral therefrom, actually engage in working the same: the chief peculiarity of the relation in this case is in the implied powers of the partners, and the fact that the transfer of the share of a partner to a stranger brings in the latter without dissolving the partnership.—**Universal partnership**, a form of association existing in Louisiana, in which all the partners agree to put in common all the wealth they have and may acquire. Exception, however, is now made of wealth acquired by gift, succession, or legacy after the partnership had been constituted.

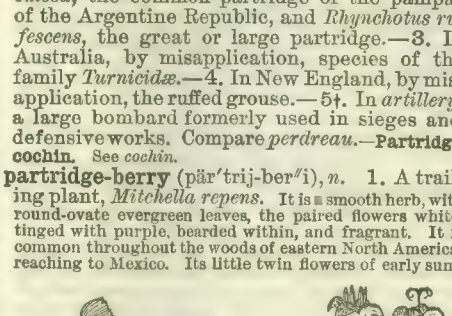
Pg. *perdiz* = It. *pernice*, *perdice*, < L. *perdix*, < Gr. πέρδιξ, a partridge.] **1.** A gallinaceous or rasorial bird of the family *Tetraonidæ* and of one or another of the subfamilies *Perdicinæ*, *Caccabinæ*, and *Ortyginæ*, of small size as compared with grouse (*Tetraoninæ*), with four toes, scaly shanks seldom spurred, fairly well-developed tail, and naked nostrils. (*a*) The birds more particularly designated partridges are the European species of the genera *Perdix* and *Caccabis*. The best-known of these is the common gray partridge, *Perdix cinerea*, the only bird of



Common Gray Partridge (*Perdix cinerea*).

the kind that is common in Great Britain, and hence the one specifically called a *partridge* in English. It extends through Europe, and in Asia is replaced by closely related forms, as *P. barbata* and *P. hodgsoniæ*. Other Asiatic birds which have *partridge* as at least the book-name are species of *Oreoperdix*, *Ammoperdix*, *Arborophila*, *Bambusicola*, etc. Those of the last-named genus are known as *bamboo-partridges*. (*b*) In Europe other birds properly called partridges are species of *Caccabis*. The red-legged, French, or Guernsey partridge is *Caccabis rufa*; the Greek partridge is *C. græca*; the rock-partridges are *C. saxatilis* and *C. petrosa*. Related to these in Asia and Africa are other species of *Caccabis*. Snow-partridges belong to the genus *Lerva* or *Tetraoperdix*, as *L.* or *T. nivicola*, and to *Tetraogallus*. Of the latter genus are the chourtka (*T. caspius*), the Himalayan partridge (*T. himalayensis*), and other species. The hill-partridges are a dozen or more species of *Arborophila*, found in India and countries further east, and several of *Galloperdix*. (See cut under *Galloperdix*.) The very numerous species of francolins are often brought under *Perdicinæ*, and some of them are called *black partridges*. They are mostly African. (See cut under *francolin*.) (*c*) All the partridge-like birds of America are entirely different from any of the foregoing, and constitute a separate subfamily called *Colinæ*, *Ortyginæ*, or *Odontophorinæ*; these are in different parts of the United States (as explained under *pheasant*) known as *partridges* or *quails* (*quail* being properly the name of the Old World birds of the genus *Coturnix*). The common partridge or quail of the United States is the Virginian bobwhite, *Colinus* or *Ortyx virginianus*, and it is the only one that is extensively dispersed in the country. But in the southwestern States and Territories are found numerous other partridges or quails, of the genera *Oreortyx*, *Lophortyx*, *Callipepla*, and *Cyrtonyx*; while ranging through Mexico and Central America and well into South America are yet others, belonging to the genera *Eupsychortyx*, *Dendrortyx*, and *Odontophorus*. See cuts under *Caccabis*, *Callipepla*, *Cyrtonyx*, *helmet-quail*, *Lerva*, *Odontophorinæ*, *Oreortyx*, and *quail*. See also *grouse*.

Passeres (pas′ẹ-rēz), *n. pl.* [NL., pl. of L. *passer,* sparrow: see *Passer*[2].] An order of the

class *Aves*, typified by the genus *Passer*, comprehending more than half of all birds. It has about the taxonomic or classificatory value of groups called *families* in departments of zoology other than ornithology. It corresponds inexactly to *Insessores* in some of the uses of this word, and exactly to the Cuvierian *Passerinæ* as emended by Blyth; also to the *Ægithognathæ* of Huxley. It consists of the *Oscines* (Müller) and *Clamatores* of Cabanis. With some exceptions, these birds (numbering upward of 5,000 species) have the following characters. They are anomalogonatous, having no ambiens muscle nor accessory femorocaudal. The femorocaudal and semitendinosus muscles are present, as is usually also the accessory semitendinosus. The flexor longus hallucis, the muscle which bends the hind toe, is separated from the flexor longus digitorum, which bends the other toes collectively; and the hind toe is inserted low down, or is perfectly incumbent. The result of this is that the feet are perfectly fitted for grasping slender supports, and the birds are thus typically insessorial. Furthermore, the toes are always 4, 3 in front and 1 behind (except in *Cholornis*); none are versatile from their normal position, and the ratio of their phalanges is always 2, 3, 4, 5, counting from the first to the fourth digit. As to the means of flight, of which no *Passeres* are deprived, the sternum has with few exceptions a particular conformation, being notched on each side behind, manubriated, and provided with prominent costal processes; the tensor patagii brevis has a special mode of insertion; the primaries are either 10 or 9 in number, the secondaries are more than 6, and the greater coverts are not more than half as long as the secondaries. The tail has 12 rectrices (with few exceptions). The palate is ægithognathous; the covering of the bill is hard, with a cere or other soft membrane, and the nostrils do not openly communicate; the oil-gland is nude; the cæca are 2 in number; and the carotid is single and sinistral. *Passeres* are altricial and psilopædic, the young being born helpless and naked. In most birds of this order the lower larynx, or syrinx, is highly developed as a musical organ, and according to this character *Passeres* are divisible into 2 primary groups—*Oscines* or *Acromyodi*, and *Clamatores* or *Mesomyodi*. The division of *Passeres*, however, has severely exercised alike the erudition and the ingenuity of the systematists, and no proposed method is fully accepted. The prime division by Garrod and Forbes, into *Eleutherodactyli* and *Desmodactyli*, is superfluous, since those alleged *Passeres* which are desmodactylous are not *Passeres*. Elimination of these obtrusive terms leaves the prime division as before, into *Acromyodi* and *Mesomyodi*. In 1874 Wallace divided *Passeres* upon external characters into 4 series: (1) *turdoid*, with 21 families; (2) *tanagroid*, with 10 families; (3) *sturnoid*, with 4 families; (4) *formicarioid*, with 10 families: 45 in all—an arrangement requiring some modification upon anatomical grounds. The mesomyodian *Passeres* are either (1) heteromerous, as the families *Cotingidæ* and *Pipridæ*, or they are (2) homœomerous. The latter are either (1) haploöphonous, as the *Tyrannidæ*, *Pittidæ*, *Philepittidæ*, and *Xenicidæ*, or they are (2) tracheophonous, as the *Furnariidæ*, *Pteroptochidæ*, *Dendrocolaptidæ*, and *Formicariidæ*. With few exceptions, mesomyodian *Passeres* are American, and nearly all of these (all but a few *Tyrannidæ*) are Central and South American. As to the acromyodian *Passeres*, they are either abnormal or normal. The abnormal *Passeres* are only two Australian families, *Menuridæ* and *Atrichiidæ*, together called *Pseudoscines*. The rest are *Oscines* proper, some 4,700 species in all, so closely related that they scarcely represent a group of higher rank than the average "family" recognized by ornithologists. They are three of Wallace's four series (turdoid, tanagroid, and sturnoid), and are separated by Sundevall into *Cichlomorphæ*, *Conirostres*, *Coliomorphæ*, *Certhiomorphæ*, *Cinnyrimorphæ*, and *Chelidonomorphæ*. Sclater has six similar divisions, though in different order and under other names: *Dentirostres*, *Latirostres*, *Curvirostres*, *Tenuirostres*, *Conirostres*, and *Cultrirostres*. These groups may be thus explained or illustrated: (1) *Cichlomorphæ* or *Dentirostres*, thrushes, warblers, flycatchers, shrikes, etc.; (2) *Coliomorphæ* or *Cultrirostres*, crows, jays, tits, etc.; (3) *Conirostres*, finches, buntings, sparrows, tanagers, etc.; (4) *Cinnyrimorphæ* or *Tenuirostres*, honey-suckers; (5) *Certhiomorphæ* or *Curvirostres*, creepers; (6) *Chelidonomorphæ* or *Latirostres*, swallows. All these birds agree in being laminiplantar; and among them or near them must be found or made a place for the larks, *Alaudidæ*, which are scutelliplantar, and which, when not placed with *Conirostres*, form a seventh superfamily known as *Corydomorphæ*.

passeriform (pas'e-ri-fôrm), *a.* [< NL. *passeriformis*, < L. *passer*, sparrow, + *forma*, form.] Sparrow-like in form or structure; pertaining to oscine *Passeres* or *Passeriformes*, or having their characters; passerine in a strict sense.

Passeriformes (pas″e-ri-fôr′mēz), *n. pl.* [NL.: see *passeriform*.] In Forbes's classification, an order of anomalogonatous birds composed of *Turdiformes*, *Fringilliformes*, and *Sturniformes*, or the turdoid, tanagroid, and sturnoid *Passeres* of Wallace, and thus equivalent to oscine *Passeres*, or *Oscines*.

Passerina (pas-e-rī′nä), *n.* [NL., fem. of L. *passerinus*, of or for a sparrow: see *passerine*.] 1. A beautiful genus of American *Fringillidæ*; the painted finches. The plumage is of bright or variegated colors, or both, as in the indigo-bird, *P. cyanea*, which is rich blue, the lazuli-finch, *P. amœna*, which is blue, white, and brown, and the painted finch, or nonpareil, *P. ciris*, which is blue, red, and yellow. *Vieillot*, 1816. Also *Cyanospiza*. See cut in next column, and cut under *indigo-bird*.

2. A genus of heath-like shrubs, belonging to the family *Daphnaceæ* and the tribe *Daphneæ*, known by its four-lobed unappendaged urn-shaped calyx, eight exserted stamens, and globose stigma. There are 4 species, all South African, sometimes cultivated for their flowers. They bear little

decussate opposite leaves, and flowers in spikes with broad bracts. *Linnæus*, 1737.

Passerinæ (pas-e-rī′nē), *n. pl.* [NL., pl. of *Passerina*.] 1. In Cuvier's system of classification, the second order of birds, approximately equivalent to the *Insessores* or perchers: primarily divided into two groups, the ordinary *Passerinæ* and the *Syndactyli*, and, secondarily, the former into four groups, *Dentirostres*, *Fissirostres*, *Conirostres*, and *Tenuirostres*. As thus constituted, it was a thoroughly unnatural group, subdivided in an equally artificial manner. But removing from it certain heterogeneous elements, as *Cypselus*, *Caprimulgus*, *Podargus*, *Colius*, *Coracias*, *Upupa*, *Merops*, *Trochilus*, etc. (as was done by Blyth, Cuvier's editor in 1849), it represents the *Passeres* of modern naturalists.

2. In Nitzsch's classification, the expurgated *Passerinæ* of Cuvier, or *Passeres* proper.

Passiflora (pas-i-flō′rä), *n.* [NL. (Linnæus, 1737), irreg. < L. *passio*, passion, + *flos* (*flor-*), flower. Early missionaries to South America, and Spanish writers from 1593, regarded the flower as an emblem of the crucifixion, finding in the five anthers the five wounds, in the three button-like stigmas the three nails, in the corona the crown of thorns, in the five petals and five sepals the ten apostles then present, in the digitate leaves the persecutors' hands, and in the tendrils their scourges.] A genus of climbing herbs or shrubs, type of the family *Passifloraceæ* and the order *Passiflorales*, characterized by the short calyx-tube, three styles, and the calyx-lobes, petals, and stamens each four or five; the passion-flowers. There are about 300 species, mainly American; a few are Asiatic and Australian. They bear lateral unbranched tendrils, and alternate leaves, undivided or lobed, often with a gland-bearing petiole. Their large and showy flowers are solitary or racemed in the axils, followed by dry or pulpy many-seeded berries, which in some species are edible. (See *granadilla*, *curuba*, *may-pop*, *indigo-berry*, 2, *water-lemon*, and *sweet calabash* (under *calabash*), also cut under *cirrus*.) Some species are narcotic or expectorant, as *P. fœtida*, the West Indian love-in-a-mist, and the bitter leaves of *P. laurifolia*, the Jamaican honeysuckle, are used as an astringent. *P. macrocarpa*, the pumpkin passion-flower of Brazil and Peru, produces a fruit sometimes weighing 8 pounds. Many species are cultivated for the beauty of their flowers, as *P. cærulea*, *P. kermesina*, etc. See also *bullhoof* and *Dutchman's-laudanum*.

Passover (pas'ō-vėr), *n.* and *a.* [< *pass* + *over*; tr. Heb. *pesach* (L. *pascha*, etc.), a passing over: see *pasch*.] **I.** *n.* 1. An annual feast of the Jews, instituted to commemorate the escape of the Hebrews in Egypt, when God, smiting the first-born of the Egyptians, "passed over" the houses of the Israelites, which were marked with the blood of the paschal lamb. It is celebrated on the evening of the 14th day of Abib or Nisan, the first month of the sacred year. The name is also used, by extension, to include the seven days that followed (from the 15th to the 21st of Nisan), during which the Israelites were permitted to eat only unleavened bread; and hence the Passover is also known as the "feast of unleavened bread." Every householder with his family ate on the first evening a lamb killed by the priest (Ex. xii.), which was served up without breaking the bones.

And ye shall observe this thing for an ordinance to thee and to thy sons for ever. . . . And it shall come to pass, when your children shall say unto you, What mean ye by this service? That ye shall say, It is the sacrifice of the Lord's *passover*, who passed over the houses of the children of Israel in Egypt, when he smote the Egyptians, and delivered our houses. Ex. xii. 24, 26, 27.

3. [*l. c.*] That which is passed over. [Rare.]

A document issued by competent civil authority, granting permission to the person specified in it to travel, or authenticating his right to protection. In some states no person is allowed to leave the country without a passport from his government, but the regulations of different jurisdictions regarding the use of passports have varied much, and of late years have exhibited a tendency toward a relaxation

of stringency, extending in many countries to their total abolition. Passports must give a description of the person. Those of the United States "request all whom it may concern to permit —— safely and freely to pass, and in case of need to give (him) all lawful Aid and Protection," and are given under the seal of the Secretary of State. Passports may be given for goods as well as for persons; and in time of war a ship's passport is a voucher of her neutral character.

In porcelain the difference is more radical, the paste of soft-paste porcelain not being strictly a ceramic production. (See *soft-paste porcelain*, under *porcelain.*) The epithets *hard* and *soft* have reference to the power of resisting heat, hard-paste porcelain supporting and requiring a much higher temperature than the other. Pasteur's method in hydrophobia consists, essentially, in progressive inoculation with less and less attenuated virus until the use of that of a high degree of intensity is attained. The virus, in its different degrees of virulency, is obtained from the spinal cord of rabid rabbits which have acquired the maximum intensity of the disease after a repeated transference of the virus from one animal to another. Sections of the cord free from foreign germs are allowed to remain, for different periods of time, in a sterilized and dry atmosphere, whereby the virulency of the virus becomes progressively diminished, until it is finally completely lost.

=Syn. *Pastime, Amusement, Recreation, Diversion, Entertainment*, play. The italicized words keep near to their meaning by derivation. The central idea of a *pastime* is that it is so positively agreeable that it lets time slip by unnoticed: as, to turn work into *pastime*. *Amusement* has the double meaning of being kept from ennui and of finding occasion of mirth (see *amuse*). *Recreation* is that sort of play or agreeable occupation which refreshes the tired person, making him as good as new. *Diversion* is a stronger word than *recreation*, representing that which turns one aside from ordinary serious work or thought, and amuses him greatly. *Entertainment* has come to have great breadth, ranging from *amusement* in its narrower sense to *diversion* and to the idea of a set exercise, as a concert, or to the articles of food furnished to guests; generally, however, *entertainment* stands for that which is social and refined.

Except in the bats, the patagium does not form a wing, and the progress of the animal through the air is not a true flight, but only a greatly protracted leap. In bats the membranous expansion is stretched chiefly between the enormously lengthened digits of the hand; in the case of the other mammals named, the patagium is for the most part a fold of the common integument of the body, stretched from the fore to the hind limb. The patagia of the pterodactyls or extinct flying reptiles were wings, constructed upon lengthened digits, much like those of bats. The case is different with the flying-lizards of the present day, in which the patagium is stretched upon extended ribs. See cut at *dragon*. Also called *parachute*. (*b*) The fold of integument which occupies the reëntrant angle between the upper arm and the forearm of a bird, bringing the fore border of the wing to a smooth straightish free edge when the wing is closed. In the eighteenth century, and especially at the court of France, the fashion of wearing patches came again into vogue, and it has been deemed an essential accompaniment to powdered hair, reappearing fitfully whenever the use of powder has been reintroduced. (*b*) The grant by a government to the author of a new and useful invention, or to his assigns, of the exclusive right of exploiting that invention for a specified term of years; also, the instrument or letters by which a grant of land is made by a government to a person or corporation. By the United States Revised Statutes, sec. 4886, etc., any person, whether a citizen or an alien, may obtain patent protection for the term of seventeen years "who has invented or discovered any new and useful art, machine, manufacture, or composition of matter, or any new and useful improvement thereof, not known or used by others in this country, and not patented or described in any printed publication in this or any foreign country, before his invention or discovery thereof, and not in public use or on sale for more than two years prior to his application, unless the same is proved to have been abandoned." The fact that the invention has been first patented in a foreign country will not debar the inventor from obtaining a valid patent in the United States, unless the same has been here "introduced into public use for more than two years prior to the application." But the patent will expire with that foreign patent having the shortest term. In the application of the several clauses of this statute, distinctions arise of difficult and delicate character, which are the constant subject of controversy. For the United Kingdom of Great Britain and Ireland and the Isle of Man, patents are granted (under the Patents and Designs Act, 1907) to any person, whether British subject or not, but a patent may be revoked after four years if not worked mainly within the kingdom. A patent is granted for a term of fourteen years, subject to the payment of the prescribed fees, and under exceptional circumstances may be prolonged. The general principles as to what constitutes an invention or improvement are substantially the same as above stated. The principal British colonies have separate statutes.

=Syn. 1. *Patience*, *Fortitude*, *Endurance*, *Resignation*. *Patience* is by derivation a virtue of suffering, but it is also equally an active virtue, as *patience* in industry, application, teaching. Passively, it is gentle, serene, self-possessed, without yielding its ground or repining; actively, it adds to so much of this spirit as may be appropriate to the situation a steady, watchful, untiring industry and faithfulness. *Fortitude* is the passive kind of patience, joined with notable courage. In *endurance* attention is directed to the fact of bearing labor, pain, contumely, etc., without direct implication as to the moral qualities required or shown. *Resignation* implies the voluntary submission of the will to a personal cause of affliction or loss; it is a high word, generally looking up to God as the controller of human life. *Resignation* is thus generally a submission or meekness, giving up or resigning personal desires to the will of God.

patina (pat′i-nä), *n.* [< L. *patina*, *patena*, a broad shallow dish, a pan: see *paten*[1], *pan*[1].] 1. A bowl; a patella.—2. (*a*) An incrustation which forms on bronze after a certain amount of exposure to the weather, or after burial beneath the ground. It is, when perfectly developed, of a dark-green color, and has nearly the composition of the mineral malachite (hydrated carbonate of copper). Such an incrustation, although very thin, is considered to add greatly to the beauty of an antique object, especially of a bust or statue, and is of importance as protecting it from further oxidation. Artificial and evanescent patinas are produced by forgers of antiquities by the application of heat or of acids, and in various other ways. Some modern bronzes acquire a dark-colored patina, which is a disfigurement rather than an ornament. Elaborate investigation on the part of various chemists has failed to explain this ill-colored patina very satisfactorily. It is believed, however, that coal-smoke in large cities may be a cause of its formation, as under such circumstances it contains particles of carbonaceous matter; and, also, that the present almost universal practice of putting considerable zinc into the bronze, to facilitate its casting, is one of the causes of this defect. The dark color of the patina of Japanese bronze has been shown, in a considerable number of cases at least, to be in all probability due to the presence of lead in the alloy. Also *patine*. (*b*) By extension, the surface-texture or -color which other works of decorative art, as a wooden cabinet or the like, gain through the action of time. patria potestas (pā'tri-ạ pō-tes'tas). [L.: *patria*, fem. of *patrius*, belonging to a father (see *patria*); *potestas*, power, < *posse*, have power, care.] In *Rom. antiq.*, a father's control and dominion over his children born in the complete Roman marriage, grandchildren, and other descendants, extending in early times to the power of life and death, and including the rights of sale into servitude, and of emancipation or discharge of the child from the privileges and charges of the family. The child had no standing before the law under the head of private rights; if he entered into a contract, the benefits were acquired not for himself, but for his father. The public rights of the child, however, remained intact, as that of voting and that of holding a magistracy.

The *patria potestas*, so long as it lasts, gives to the father the complete control of the son's actions.
Encyc. Brit., XIII. 1.

patriarch (pā'tri-ärk), *n.* [Early mod. E. also *patriark*; < ME. *patriark*, *patriarke* = OF. *patriarche*, F. *patriarche* = Sp. *patriarca* = Pg. *patriarca*, *patriarcha* = It. *patriarca* = D. The father and ruler of a family; one who governs by paternal right; specifically, one of the progenitors of the Israelites—Abraham, Isaac, Jacob, and the sons of Jacob; also, one of those Biblical personages who were heads of families before the deluge: the latter are termed *antediluvian patriarchs*.

Hence—2. In subsequent Jewish history, one of the heads of the Sanhedrim after the destruction of Jerusalem and the dispersion, the patriarch of the Western Jews residing in Palestine, that of the Eastern in Babylon.—3. In the early church, and in the Orthodox Greek and other Oriental churches, a bishop of the highest rank; in the Roman Catholic Church, a bishop of the highest rank next after the Pope. In the early church the highest dignity, which came in time to be designated as that of *patriarch*, belonged from time immemorial, and as was believed from apostolic days, to the bishops of Rome, Alexandria, and Antioch—these three sees ranking as to dignity, precedence, and privileges in the order named. The Council of Constantinople (A. D. 381) gave the bishop of that see prerogatives of rank next after Rome. A remnant of the Council of Chalcedon conferred an equality of prerogatives with Rome, but Pope Leo I. refused to confirm this decree. Since that schism Constantinople has always stood at the head of the orthodox Oriental sees, and since the ninth century its bishop has borne the title of *ecumenical patriarch*. The patriarchal dignity of Jerusalem was not recognized till the Council of Chalcedon. Constantinople, Alexandria, Antioch, and Jerusalem still remain the four great patriarchates of the orthodox Eastern Church. In 1582 Moscow was made a patriarchate, ranking next after these, but since 1721 the place of patriarch of Moscow has been represented by the Holy Governing Synod. Besides the orthodox Oriental patriarchs, there are others, representing the Armenian, Jacobite, Coptic, and other Oriental churches, and also Latin or Roman Catholic titular patriarchs of the same sees. In the Roman Catholic Church the Pope is regarded as having in his papal capacity a rank superior to his rank as patriarch, and the cardinals also take precedence of patriarchs. There are also three minor patriarchs in the Roman Catholic Church—of the Indies, of Lisbon, and of Venice. The title of *patriarch* seems to have first come into use in the Christian church in imitation of a similar title given to the head of a Jewish *patria*, or group of communities. In general usage it was apparently first given, without definite limitation, to senior bishops or bishops of special eminence. The bishops of the great patriarchal sees were at first called *archbishops* (in the older sense of that title). From the fourth century the title of *patriarch* came to be commonly applied to the bishops of the patriarchal sees, and is so used in imperial laws of the sixth century. It was not, however, till the ninth century that it became strictly limited to these. Exarchs, metropolitans, and archbishops rank next after patriarchs. See *catholicos*.

The Primate of all England was also *Patriarch* of all the British islands. *E. A. Freeman*, Norman Conquest, V. 158.

In correctness of speech, we are assured by Theodore Balsamon, the *Patriarch* of Antioch is the only Prelate who has a claim to that title—the proper appellation of the Bishops of Rome and Alexandria being Pope; of Constantinople and Jerusalem, Archbishop.

See *pattern-chain* and *pattern-cylinder*. Also called *shuttle-box*. (*b*) The box perforated to accord with the harness-cards of a Jacquard loom. Also called *prism* or *cylinder*.

Hence—(*b*) A number of such pieces of cardboard, forming a sort of book, or folding alternately so as to open out in a long strip and exhibit, at one time, a number of patterns of stuff.—**2.** In *weaving*, one of the perforated pieces of cardboard used in the Jacquard attachment to a loom. The cards are joined together in a flexible endless chain, and pass over the pattern-box, each in turn controlling the harness-system. Whenever a hole in a card and one in the box coincide, the corresponding rod connected with a warp-thread enters the hole and its warp-thread is raised. See *loom*[1].

pattern-chain (pat′ėrn-chān), *n.* In *weaving*, a device for automatically bringing the shuttles to the picker, according to the sequence required by the pattern. In one form, in the shuttle-boxes at the ends of the race, the links of the chain vary in height, so as to raise the rod connected with the shuttle-boxes more or less, thus bringing one shuttle or another into position to be struck by the picker.

pattern-cylinder (pat′ėrn-sil″in-dėr), *n.* In *weaving*, a cylinder, or in some forms of loom a wheel, with projections so arranged on its periphery that its movement shall control the harness-system and the pattern-boxes, and thus fix the pattern of the woven fabric. Also called *pattern-wheel*.

pattern-maker (pat′ėrn-mā″kėr), *n.* In *mech. engin.*, a workman who makes the patterns used by molders in foundry-work. These patterns are usually made, in the first instance, of pine or mahogany, the pattern-maker working from drawings. If the patterns are to be much used, they are frequently duplicated in metal, the pattern after casting being filed and scoured smooth, then warmed, and coated with wax. Metal patterns have the advantage of not warping like wood patterns. Patterns are also sometimes made of plaster of Paris swept by templets while in a plastic state. This method has been successfully applied in architectural ironwork in the production of cornices and analogous forms. Pattern-making is a distinct trade, requiring great skill in wood-working, combining as it does the finest joinery-work with the art of wood-carving and the ability to read and interpret the most complicated mechanical drawings.

Application of payments, appropriation of payments, the determining which of several obligations shall be extinguished or reduced, when a payment not sufficient to extinguish all is made. Thus, if a debtor owing to the same creditor an open account, a bond, and a note secured by mortgage on the debtor's property pays a sum sufficient to satisfy only one, it is for his interest that it be applied to the mortgage, so as to free his property from incumbrance; and it is for his creditor's interest that it be applied to the open account, which is unsecured, and will be outlawed before the bond. The right of application rests with the debtor at the time of paying. If he does not exercise it, it passes to the creditor. If neither debtor nor creditor exercises the right, the court, if controversy arises, makes the application on equitable principles.—**Equation of payments.** See *equation*.—**Payment into court,** the deposit in due form with an officer of the court of a sum sued for, or of so much as is admitted to be due, for the benefit of the plaintiff if he will accept it.

The plural of *pea* is *peas*, as 'as like as two *peas*,' 'a bushel of *peas*,' with ref. to the individual seeds, as in 'a bushel of beans'; but when used collectively the old singular *pease* is properly used, as 'a bushel of *pease*,' like 'a bushel of wheat or corn.'] **1.** The seed of an annual hardy leguminous vine, *Pisum sativum;* also, the vine itself. The pea is marked by its climbing habit and glaucous surface, its pinnate leaves ending in a branching tendril, its large stipules, and its large, commonly white, papilionaceous flowers, followed by pendulous pods containing sweet nutritious seeds. The original form of the pea, *Pisum arvense*, the common gray pea or field-pea, is thought by some to be native in Greece and the Levant, by others to have come from farther north. Peas were known to the ancient Greeks and Romans, and their cultivation is now general. Usually only the seeds are edible, but the pods of the sugar-pea, skinless pea, or string-pea are eaten, as in the case of "string-beans." The seeds are now mostly consumed when green, but are also split when ripe, and used in soups or ground into meal. (See *pease-meal*.) Before the spread of the potato, peas formed in England a principal food of the working classes. The varieties are very numerous, those of the marrow class being distinguished by seeds which are wrinkled and greenish even when ripe.

The peach is a rather weak irregular tree, 15 or 20 feet high, with shining lanceolate leaves, and pink flowers (see cut under *calyciflorate*) appearing before the leaves. The roundish or elliptical fruit is 2 or 3 inches in diameter, and covered with down; when ripe, the color is whitish or yellow, beautifully flushed with red; its flesh is subacid, luscious, and wholesome. The peach is closely allied to the almond, from which Darwin inclines to derive it. Its local origin has commonly been ascribed to Persia, but the investigations of De Candolle point to China. It is now widely cultivated in warm-temperate climates, most successfully in China and the United States, as in Delaware, on the shores of the Chesapeake and Lake Michigan, and in California. (See *curl*, 4, *peach-blight*, and *peach-yellows*.) The canning of peaches is now a large local industry; large quantities also are dried, and some are made into peach-brandy. The seeds often take the place of bitter almonds as a source of oil, etc. Peach-leaves and -flowers are laxative and anthelmintic. The varieties of the peach are numberless, a general distinction lying between clingstones and freestones (see these words), and again between the white- and the yellow-fleshed. (See *nectarine*.) The flat peach or peento is a fancy Chinese variety, having the fruit so compressed that only the skin covers the ends of the stone. Another Chinese variety, the crooked peach, has the fruit long and bent, and remarkably sweet. In ornamental use there is a weeping peach; and various dwarf and double-flowered varieties, called *flowering peaches*, have been produced with pure-white or variously, often very brilliantly, colored flowers.—**Guinea peach,** a climbing shrub, *Sarcocephalus sambucinus*, of tropical western Africa, bearing heads of small pink flowers, and a pulpy collective fruit which is eaten by the natives. These tail-coverts are elegantly formed of spray-like decomposed webs enlarged and recomposed at the end, and marked with glittering ocelli or "eyes." This whole mass of plumage is capable of being erected and spread in a vertical disk completing a semicircle, or more, of the most brilliant iridescent colors, chiefly green and gold. The tail-feathers proper and the primaries are chestnut; the neck and breast are blue of a peculiarly rich tint called *peacock-blue*. The head is crested with a bunch of about twenty-four upright plumes. The length proper is about four feet, the train, when fully developed, measuring from two to four feet more. The peahen is much smaller and more plainly feathered, without the train. The peacock was sacred, among the Greeks and Romans, to Hera or Juno, but is now commonly regarded as the symbol of vainglory and as a bird of ill omen. The flesh is edible, like that of other gallinaceous birds. The cry is extremely loud and harsh. See *Pavo*, *japanned;* also cut under *ocellate*.

peag, peak[4] (pēg, pēk), *n.* [Mass. Ind. *piak* (pl.), shell money.] Among the North American Indians, in colonial days, a sort of money consisting of beads made from the ends of shells, rubbed down and polished and strung into belts or necklaces, which were valued according to their length and the perfection of their workmanship. Black or purple peag was worth twice as much as white, length for length.

Peak is of two sorts, or rather of two colors, for both are made of one shell, though of different parts; one is a dark purple cylinder, and the other a white; they are both made in size and figure alike, and commonly much resembling the English bugles, but not so transparent nor so brittle. *Beverley*, Virginia, iii. ¶ 46.

2. The tree *Pyrus communis.* The wild tree is common over temperate Europe and Asia, often scrubby, but under favorable conditions becoming, as under culture, a handsome tree of good height, inclining to a pyramidal form. Though close to the apple botanically, it differs in its more upright habit, smooth shining leaves, pure-white flowers with purple stamens, the granular texture of the wild fruit, the juicy melting quality of the fine varieties, and the form of the pome, which tapers toward the base and has no depression around the stem. The tree is long-lived, specimens existing which are two or three hundred years old. The pear was known in a number of varieties in the days of Pliny, but its excellence is of much later date. In recent times it has received great attention, its culture being pushed with special zeal in France. It is a highly successful fruit in the United States. The varieties of pear are numbered by thousands, but only a few are really important. The Seckel is an American variety—the fruit small, but unsurpassed in quality. The Bartlett, known in Europe, where it originated, as *Williams's bon Chrétien,* is also universally popular. Pomologists place some others, as the *beurre d'Anjou,* as high as these or higher. Dwarf pears (that is, those grafted or budded on quince-stocks) are more convenient for gardens; standard pears (that is, those grafted or budded on seedling-pear stocks) are commonly more profitable. In some regions, as England and northern France, a liquor is made from the juice of the fruit. (See *perry*[1].) Pear-wood has a compact fine grain, and is highly prized for cabinet- and mill-work, etc., and second only to boxwood for wood-engraving and turnery.

Sp. *perilla*, a little pear, a pear-shaped ornament, Olt. *perolo*, a little button or tassel (Florio). Cf. *purl*[2].] **1.** A nacreous concretion, or separate mass of nacre, of hard, smooth, lustrous texture, and a rounded, oval, pear-shaped, or irregular figure, secreted within the shells of various bivalve mollusks as a result of the irritation caused by the presence of a foreign body, as a grain of sand, between the mantle and the shell. The formation of a pearl is an abnormal or morbid process, comparable to that by which any foreign body, as a bullet, may become encysted in animal tissues and so cease to cause further irritation. In the case of the mollusks which yield pearls, the deposition is of the same substance as the nacre which lines the shell, hence called *mother-of-pearl*, in successive layers upon the offending particle. Fine pearls have frequently been found in working the mother-of-pearl shell. Chemically, pearls consist of calcium carbonate interstratified with animal substance, and are hence easily dissolved by acids or destroyed by heat. The chief sources of the supply of pearls are the pearl-oysters and pearl-mussels, *Aviculidæ* and *Unionidæ*, and foremost among the former is the pearl-oyster of Indian seas, *Melcagrina margaritifera*. Pearls are generally of a satiny, silvery, or bluish-white color, but also pink, copper-colored, purple, yellow, gray, smoky-brown, and black. The finest white pearls are from Ceylon, the Persian Gulf, Thursday Island, and the western coast of Australia. The yellow are from Panama. The finest black and gray pearls are obtained in the Gulf of California, along the entire coast from Lower California to the lower part of Mexico. There are two distinct varieties of pink pearl: those from the common conch-shell, *Strombus gigas*, of the West Indies, and those from the unios or fresh mussels found in Scotland, Germany, France, and the United States (the finest being obtained principally from Ohio, Tennessee, Kentucky, Texas, and Wisconsin), also from the small marine shell *Trigona pectonensis* of Australia. Purple, light-blue, and black pearls are found in the common clam, *Venus mercenaria*. The yellow color of Oriental pearls generally results from the decomposition of the mollusks in which they are found. The value of a pearl depends entirely on its perfection of form (which must be either round, pear-shaped, or a perfect oval), on its luster or "orient," and on the purity of its color, a tint of yellow or gray detracting very much from the value. Pearls are sold by the pearl-grain, four grains equaling one carat. (See *carat*, *n.*, 4.) From 1880 to 1890 the demand for pearls and the rarity of their occurrence resulted in an advance in price of from 250 to 300 per cent., the larger pearls having advanced more, proportionally, than the smaller ones. Until about 1865, pearls were generally valued as multiples of a grain. The value of a pearl larger than one grain was estimated by squaring its weight and multiplying this by the value of a one-grain pearl: thus, a two-grain and a five-grain pearl were worth respectively 4 and 25 times the value of a one-grain pearl.

Eng.]—**11.** *Eccles.*, a name sometimes given to a particle of the consecrated wafer: still current in the Oriental Church.—**12.** A name given by gilders and manufacturers of jewelry to granules of metal produced by melting it to extreme fluidity, and then pouring it into cold water. The stream in pouring should be so small, and the crucible held at such a distance from the water, that the metal will break up into fine drops (pearls) before reaching the water, which instantly cools them. The cooled granules are usually pear-shaped. The epithet *granulated* is more commonly applied in the United States to metals prepared in this way, as granulated copper, silver, zinc, etc., used in the preparation of jewelers' alloys on account of their convenience in weighing, and for other purposes—pure granulated zinc being much employed by chemists for generating pure hydrogen gas, as in Marsh's test for arsenic, etc.

See *purl*.—**Baroque pearl.** See *baroque*.—**Blind pearls**, irregular, lusterless, and valueless pearls, used for medicinal purposes in the East.—**Epithelial pearls**, small spheroidal masses of flattened epithelial scales, concentrically arranged, occurring in epitheliomata. Also called *bird's-nest bodies* and *epidermic spheres*.—**Half pearls**, pieces cut from pearls that are very irregular and have only one lustrous side or corner, which is slit off. They are extensively used in jewelry, and are much less expensive than whole pearls, but are very liable to become discolored if wet, as the layers of the pearl, being cut across, absorb the water, and any impurities it may contain show through the layers.—**Imitation, artificial, or false pearls** are of two kinds, *solid* or *massive pearls* and *blown pearls*. (See *Lemaire pearl* and *Roman pearl*.) The first are known as *Venetian pearls*, and are manufactured chiefly on the island of Murano, near Venice. They are made from small white or colored glass tubes, the desired hues being produced by the use of oxid of tin and other metals. Blown pearls consist of small globules of thin glass, coated on the inside with the so-called oriental-pearl essence, or essence d'orient. Their manufacture is attributed to Janin or Jalquin, who lived in Paris about 1680, and who was the first to line hollow glass balls with this mixture, which he prepared with the scales of a small fish, the bleak, common in France and Germany, and mucilage. The mixture was first suggested by his observing the pearly luster of the scales that were detached from the fish when they rubbed against one another in a trough. The scales of 18,000 fish are required to make one pound of oriental-pearl essence.—**Inner pearl**, in *lace-making*, ornamental loops worked around the edge of an opening in lace, as distinguished from *pearl*, which is a loop on the outer edge.—**Large pearl**, in *confectionery*, the condition of clarified sugar-syrup when it has been boiled to such a consistency that, when a drop is taken between the finger and thumb, these may be separated to the greatest extent without breaking the connecting thread of syrup. In this condition the sugar forms a large drop, or "pearl," if suspended from a rod.—**Lemaire pearl**, an imitation pearl composed of a solid glass ball externally coated with a varnish composed of oriental-pearl essence, white wax, alabaster, and parchment glue. *A. Castellani*, Gems.—**Little pearl**, in *confectionery*, the condition of clarified sugar-syrup when it has been boiled to such a consistency that, when a drop is taken between the finger and thumb, the finger and thumb may be separated to nearly the full extent without breaking the thread of syrup. Large quantities are used in the East for medicinal purposes, in the composition of electuaries supposed to possess stimulating and restorative qualities.—**Small pearl.** Same as *little pearl*.—**Smoked pearl**, mother-of-pearl having black or very dark veins or cloudings.—**Virgin pearls**, unpierced pearls of fine quality.

Cf. *purse*, var. of *burse*.] **1.** Partly decomposed vegetable matter, produced under various conditions of climate and topography, and of considerable importance in certain regions as fuel. Peat occurs in many countries and in different latitudes, but always either in swampy localities or in damp and foggy regions. It is formed of vegetable matter undergoing decay, and in some respects it is the modern representative of the coal of the earlier geological epochs, and its formation illustrates the conditions under which coal has originated. Peat is abundant in northern Europe, and particularly so in Ireland, where it is perhaps of greater importance as fuel than in any other country. It occurs in India, especially in the Neilgherry hills and in Bengal; also in various parts of the United States, and there are in the latter country regions (especially in New England) where it is occasionally used as fuel. The vegetation of which peat is made up in the various countries where it occurs is quite different, and occasionally the number of species which have taken part in its formation is large. The genus *Sphagnum* is an important element in much of the European peat. The peat of Bengal, on the other hand, is said to be formed almost exclusively from one plant, a species of wild rice. The peat of New England is made up of a considerable variety of aquatic plants. Peat is very spongy, and contains a large amount of water near the surface; the deeper down it is taken, the more compact it is. A great variety of processes for compressing and hot-drying it have been invented and put in use in different parts of the world.

peat-charcoal (pēt′chär′kōl), *n.* Charcoal made by carbonizing peat. This is done in various ways, as in piles, open kilns, pits, and ovens. Peat-charcoal has been much experimented with, and used in metallurgical operations to some extent for fully three hundred years. The carbonization of ordinary air-dried peat produces a very friable charcoal, and the denser the peat is made, by compression or in other ways, the better the article produced.

In France *peat-charcoal*, under the name of Charbon roux, is much used for making gunpowder. *Ure*, Dict., III. 527.

peat-moor (pēt′mör), *n.* Same as *peat-moss*. In the United States such deposits are called *swamps* or *bogs*. See *peat*[1] and *peat-moss*.

Peat is very largely dug in the moorlands of Somersetshire, near Edington and Shapwick, between Glastonbury and Highbridge. Some of these beds have been worked for fuel from the time of the Romans, and probably earlier, while others are of more recent formation. The *peat moors* or "turbary lands" have an irregular distribution; and the peat, which in places is 14 or 15 feet thick, is due largely to the growth of the common sedge (Carex), whence Sedgemoor derives its name.
Woodward, Geol. of England and Wales (2d ed.), p. 526.

peat-moss (pēt′môs), *n.* **1.** Moss entering into the composition of or producing peat; moss of the genus *Sphagnum*.—**2.** A peat-bog or -swamp: a name frequently given in Great Britain to those accumulations of peaty matter which in the United States are commonly known as *peat-bogs*.

pea-weevil (pē′wē′vl), *n.* A kind of beetle, *Bruchus pisi*, which infests peas. It is an indigenous North American insect, which probably fed on some other legume before the cultivated pea was introduced; it has spread to Europe, and is now found in Great Britain and along the Mediterranean. The egg is laid on the outside of the pod, and the newly hatched larva burrows into the nearest pea, in which it feeds and grows to full size. Before transforming to the pupa it provides for its exit by cutting a round hole through all but the outer membrane of the pea. The beetle does not issue until the following spring. See *Bruchus*. Also called *pea-beetle*, *pea-bug*, and *pea-chafer*.

pebbling (peb'ling), *n.* [Verbal n. of *pebble, v.*] In *leather-manuf.,* a special kind of graining, in which an artificially roughened or indented surface on the grain side of leather is produced by working upon that side with a roller having a pattern which is the reverse of the pattern to be impressed on the leather. The term is properly restricted to the act of producing an irregular pattern, such as would be produced by pressing irregularly distributed minute pebbles upon the leather: whence the name. A pattern consisting of straight or approximately straight lines is called a *straight grained pattern,* and the leather would be called *straight-grained.* The term *graining* includes pebbling, which is but a special kind of graining, of which glassing or glazing is still another variety.

pebbling-machine (peb'ling-ma-shēn″), *n.* In *leather-manuf.,* a machine resembling a polishing-machine in its construction, used to perform the special work called pebbling. The pebbling is done by a roller having on its surface the pattern, in reverse, which it is desired to impart to the grain of the leather. The roller is pivoted to elastic bearings at the lower end of a swinging arm, and is antagonized by a table curved to correspond to the arc through which the roller acts. The leather is supported by the table while subjected to the action of the roller. The imparting of a pattern in imitation of more costly leather is strictly a variety of graining, though often called *pebbling.* Since the machine used for glassing, glazing, or polishing is transformed into a pebbling-machine by a change in the roller only, the machine is variously and indifferently called *polishing-, glassing-, graining-,* or *pebbling machine.*

Pecopterideæ (pē-kop-te-rid'ē-ē), *n. pl.* [NL., < *Pecopteris* (*-rid-*) + *-eæ*.] A group of fossil ferns to which belongs the widely disseminated and highly important genus *Pecopteris*. Schimper has grouped the *Pecopterideæ*, with regard to their relation to living ferns and with reference to the character of the fructification, in five subdivisions; but "one has only to look at the classification of a few species grouped from the apparent character of the fructifications to see how unreliable are the diagnoses derived from them" (*Lesquereux*). The grouping of the *Pecopterideæ* suggested by the fossil botanist of the Pennsylvania Geological Survey is as follows: (1) Including the species referred by Schimper to the genus *Goniopteris*, distinguished by an upward curve of the lateral veins; (2) *Pecopteris* proper, or cyatheids, to which division belong the species answering exactly to Brongniart's definition of the genus *Pecopteris*; (3) *Pecopteris* with hairy or villous surfaces, a permanent and easily discernible character; (4) *Pecopteris* with pinnæ not distinctly divided into obtuse entire lobes or pinnules, but generally cut on the borders in sharp irregular teeth; and (5) a group containing those species referred to *Pecopteris* which "do not find a place in the former divisions." The pecopterid group is thus seen to be based on the characters of the sterile fronds. Its varied types of fructification embrace many genera, not all belonging to the same family, though mostly eusporangiate.

Pecopteris (pē-kop'te-ris), *n.* [NL., < Gr. *πέκειν*, comb, + *πτερίς*, a fern.] One of the great artificial genera of fossil ferns established in accordance with the classification of these on the basis of the characters of the sterile fronds, as first proposed by Brongniart in 1822. Fully established by Sternberg (1825), it includes very many species, chiefly Carboniferous, characterized by tripinnate or quadripinnate fronds bearing usually oblong, broad, parallel-margined, obtuse and entire, though rarely acute and dentate, close pinnules attached to the rachis by their whole width, or partially confluent, with simple or dichotomous open nervilles derived pinnately from a single distinct, not very thick, fairly persistent median nerve. The highly diverse fructifications, mostly eusporangiate, discovered on fronds of this artificial genus constitute a number of valid extinct genera, including *Ptychocarpus, Asterotheca, Scolecopteris, Dactylotheca*, and *Danæites*.

See *key*[1].—**Pedal keyboard**, in *organ-building*, the keyboard or set of levers intended to be played by the feet. It consists of black and white keys like the manual keyboards, only on a larger scale. Its usual compass in modern organs is from the second C below middle C to the D or the F next above it. It is sometimes *concave*, the extreme right and left levers being higher than those in the middle, or *radiating*, the front ends of the levers being nearer together than the back ends—both arrangements being intended to help the player to reach all the keys with equal ease. The pedal keyboard properly sounds the stops of the pedal organ; but it may also be coupled with either of the manual keyboards, and thus may simply extend the resources of the latter. Pedal keyboards are sometimes added to reed-organs, and even to pianofortes. See *pedalier*, and cut under *organ*.—**Pedal line**, a line through the feet of the three perpendiculars to the three sides of a triangle, let fall from any point on the circumference of the circumscribed circle.—**Pedal muscle**. Its compass is usually about two or two and a half octaves. Its stops are the deepest and most sonorous in the instrument, usually of 16- or 32-feet tone.—**Pedal origin**, the fixed point from which the perpendiculars are let fall.—**Pedal passage**, in *organ-music*, a passage or phrase intended to be performed on the pedal keyboard.—**Pedal piano**, a pianoforte with a pedal keyboard or pedalier.—**Pedal pipe**, in *organ-building*, one of the pipes belonging to the pedal organ.—**Pedal ratio**. II. *n.* (ped'al). 1. Any part of a machine or apparatus which is intended to receive and transmit power from the foot of the operator; a treadle: as, the *pedals* of a bicycle.—2. In musical instruments, a foot-lever; a metal or wooden key or projecting bar operated by the foot. (*a*) In the pianoforte two or three pedals are in use: one to lift the dampers from the strings (the *damper-pedal* or *loud pedal*); one to introduce a muffler between the hammers and the strings, or to lessen the distance from which the hammers strike, or to move them so that they shall strike only one string instead of the usual two or three (the *soft pedal*); and sometimes one to hold up the dampers that happen to be lifted when the pedal is pressed down (the *sustaining pedal*). The use of the damper-pedal is indicated by *ped.* at the beginning of the passage where it is needed, and by a * at its end. The use of the soft pedal is usually indicated by some such expression as *una corda*, 'one string.' The use of the sustaining pedal is usually left to the player's discretion. (*b*) In the pipe-organ several different kinds of pedals are used: those which form the pedal keyboard, and which are like the keys or digitals for the hands, but much larger (see *pedal keyboard*, and cut under *organ*[1]); those which control the drawing of one or more of the stops (*combination pedals*, *composition pedals*, *crescendo pedal*, *diminuendo pedal*, *sforzando pedal*, etc.); that which controls the opening of the blinds or shutters of the swell-box (the *swell-pedal*), etc. See the phrases below. (*c*) In the reed-organ and harmonium, one of the treadles by which the player operates the feeders of the bellows. See *reed-organ*. (*d*) In the harp, one of the foot-levers whereby all or some of the strings may be temporarily shortened, and their pitch raised. In modern harps seven pedals are used, any one of which may be used in two ways, raising the pitch either one or two half-steps; every pedal affects only the strings of a particular letter-name. By combining the pedals in various ways the instrument may be set in any desired key (tonality). See cut under *harp*. (*e*) Collectively, same as either *pedal keyboard* or *pedal organ*.

3. Same as *organ-point*.—4. A pedal curve or surface, or one of which another is the pedal curve or surface.—**Balanced pedal**. See *swell-pedal*.—**Combination pedal**, in *organ-building*, a metal pedal which enables the player to control the use of several stops at once by his feet. Such pedals are placed above the pedal keyboard. They are either *single-* or *double-acting*—the former serving either to draw or to retire certain stops, the result depending upon the registration at the moment when the pedal is used, and the latter serving both to draw and to retire certain stops, so that the result is always the same whenever the pedal is used. Combination pedals are applied to the stops of all the keyboards, usually beginning with those of the great organ. They include a *forte pedal* (single-acting), which draws all the stops of the keyboard to which it belongs; a *mezzo pedal* (usually double-acting), which draws most of the important 8-feet and 4-feet stops of its keyboard; and a *piano pedal* (single-acting), which retires all but one or two of the lighter stops. Combination pedals do not always affect the stop-knobs; if not, they are so made as to be hooked down when in use, and when they are released the combination made by the stop-knobs remains unchanged. Combination pedals of all the above varieties often control also certain of the stops of the pedal organ, so that, when a given combination on the manuals is used,

appropriate pedal stops are also drawn.—**Composition pedal.** Same as *combination pedal.*—**Coupler-pedal,** in *organ-building,* a pedal which controls one of the couplers, usually that which unites the great and pedal organs.—**Crescendo pedal.** See *crescendo.*—**Diminuendo pedal.** See *crescendo pedal,* under *crescendo.*—**Double-acting pedal.** See *combination pedal.*—**Extension-pedal.** Same as either *damper-pedal* or *sustaining pedal.* See def. 2 (*a*).—**First negative pedal,** the locus to which the basis locus is the pedal.—**First pedal,** the pedal curve or surface.—**Forte pedal.** See *combination pedal.*—**Harp pedal.** Same as *soft pedal.*—**Inner pedal.** See *inner.*—**Loud pedal.** See def. 2 (*a*).—**Mezzo pedal.** See *combination pedal.*—**Oblique pedal,** a plane curve the locus of intersections under a constant angle of lines through a fixed point with tangents to a fixed curve.—**Open pedal.** Same as *loud pedal.*—**Piano pedal.** See *combination pedal.*—**Ratchet-pedal.** See *swell-pedal.*—**Rat-trap pedal,** a kind of foot-piece used on some bicycles and velocipedes, consisting of a flat iron or steel bar bent into oblong-rectangular form, and having its meeting ends welded together. The pedal-pivot passes midwise from end to end of the pedal, through holes made in the ends; and the upper edges of the longer parallel sides are serrated. The whole thus much resembles a small steel trap with open jaws, as when set for catching rats, etc., whence the name.—**Reversible pedal.** See *coupler-pedal.*—**Second pedal,** the pedal of the pedal.—**Sforzando pedal,** in *organ-building,* a pedal which suddenly and temporarily brings the entire power of the instrument into use, so that a forcible accent can be produced.—**Single-acting pedal.** See *combination pedal.*—**Soft pedal.** See def. 2 (*a*).—**Sustaining pedal.** See def. 2 (*a*).—**Swell-pedal,** in *organ-building,* a pedal which opens the shutters or blinds of the swell-box, and so increases the power of the tones produced by the pipes in it.—**Toe-and-heel pedal.** Same as *balanced pedal.*

The *pedicellariæ* are . . . dermal organs of a peculiar character which are found in the Asteroida as well as in the Echinoida. They consist of a stalk-like muscular process of the integument, which is supported at its end by a fine calcareous skeleton; it terminates in two or three pincer-like valves which are movable on one another.

There are about 125 species, mostly montane, alpine, or arctic, natives of Europe, North America, and northern and central Asia, and (a very few) of the mountains of South America and India. They are perennial herbs, with the leaves pinnately or irregularly cut, developed chiefly at the base of the stem and becoming bract-like above. The flowers form a terminal spike, usually yellow or reddish, often one-sided, and followed by compressed projecting curved and beaked capsules. *P. Canadensis* is the wood-betony or high heal-all, common in North American woodlands, with fine-cut fern-like leaves and curving yellow and red variegated flowers. *P. Sceptrum-Carolinum* is the King Charles's scepter, a tall wand-like European species with abundant purple and gold flowers. Some species are cultivated, chiefly from seed, and are known collectively as *lousewort*, a name derived from the common British heath- and swamp-lousewort or red-rattles, long imagined to breed lice in sheep that feed on them—an idea apparently founded merely on their presence in poor soil.

(*c*) A suborder referred to the order *Acanthopterygii* or *Teleocephali*. (*d*) An order divided into the families *Lophiidæ*, *Antennariidæ*, *Ceratiidæ*, and *Ogcocephalidæ*. Generally accepted in sense (*b*) by European ichthyologists, and in sense (*d*) by all recent American ichthyologists. The principal characters are the connection of the vertebral column with the skull by suture, the junction of the epiotics behind the supraoccipital, the elongation and reduced number of the actinosts supporting the pectorals, and the position of the branchial apertures in the axillæ of the pectorals. See cuts under *angler*, *antennariid*, *batfish*, and *Ceratiidæ*.

E. also *pedigre*, *pedegree*, *pedigrew*, *petigree*, *pettigre*, *pettigrew*, *petygrewe*, *pettegrye*, < ME. *pedegru*, *pedegrw*, *pedygru*, *pedegrewe*, *petygrwe*, in Prompt. Parv. (A. D. 1440), also in documents a few years earlier, *pedegrewe*, *petygreu*, *peedigree*, and in ML. *pedicru*, *pe de gre*, pedigree—the orig. type indicated by these forms being *pedegru*, or **pedegrue*, or as three words **pe de grue*, obviously of OF. origin. The only OF. term answering to this form is *pied de grue*, crane's foot: *pied*, *piet*, *pie*, nom. also *pez*, < L. *pes* (*ped-*), foot; *de*, < L. *de*, of; *grue*, < L. *grus*, crane: see *foot* (and *pedal*, etc.), *de*2, *Grus*, and *crane*1. No record of the use of OF. *pied de grue* in the sense of 'pedigree,' or in any relation thereto, has been found; if so used (and no other explanation of the ME. forms seems possible), it must have been a fanciful application, in restricted AF. use, perhaps in allusion to the branching lines of a pedigree as drawn out on paper (cf. *crow's-foot*, applied to the lines of age about the eyes). The crane was at the time in question very common in England and

France, and it figures in many similes, proverbs, and allusions. The term appears to be extant in the surname *Pettigrew*, *Pettygrew* (from the early mod. E. *pettigrew*, ME. *petygru*, etc.). For the form, and the use as a surname, cf. the modern surname *Pettifer*, *Petifer*, < ME. *Pedifer*, *Pedefer*, < OF. *pied de fer*, 'iron foot.' Of the various other explanations of *pedigree*, as OF. *par degréz* (Minsheu), 'by degrees,' "*pere degréz*, i. e. descensus seu parentela maiorum" (Minsheu), lit. 'father-degrees,' "*petit degree*" (actually so spelled in one instance in Stanihurst), or other suggestions involving *petty* or *degree*, none is tenable. The mod. F. *pédigree* is from E.] Line of ancestors; descent; lineage; genealogy; list of ancestors; genealogical tree.

= **Syn.** *Pedigree*, *Genealogy*, *Lineage*. *Pedigree* may be used with reference either to a person or to an animal, as the *pedigree* of a horse; the others only to a person or family. In some cases it extends to geologic time: as, the *pedigree* of Cænozoic horses. *Genealogy* is the series of generations, coming down from the first known ancestor. *Lineage* views the person as coming in a line of descent, generally honorable, which, however, need not be traced, as in a *genealogy* or *pedigree*. *Pedigree* and *lineage* are generally much narrower words than *genealogy*, the last usually covering some personal history and including details of various matters of interest to the persons or families concerned.

There are about 15 species, all American, from Mexico and the West Indies to northern Brazil. They bear fleshy branches, with an acrid milky juice, alternate stem-leaves and opposite floral leaves, and flowers surrounded by greenish or colored involucres, arranged in terminal or axillary cymes. Several species are cultivated as evergreen shrubs in greenhouses, and from the shape of the involucre are known as *slipper-plants*. *P. tithymaloides*, of the West Indies and South America, known as *jew-bush*, is used in medicine as an emetic.

A group of marsupial or didelphian mammals, the American opossums: so called from the hand-like structure and function of both hind and fore feet. It has lately been adopted as one of eight "orders" of marsupial mammals.

In *arch.*, a low triangular part resembling a gable, crowning the fronts of buildings in the Greek styles, especially over porticos. It is surrounded by a cornice, and its flat recessed field or tympanum is often ornamented with sculptures in relief or in the round. Among such sculptures are found the finest remains of Greek art — the pediment-figures of the Parthenon, by Phidias. In the debased Roman and Renaissance styles the same name is given to gables similarly placed, even though not triangular in form, but semicircular, elliptical, or interrupted, and also to small finishing members of any of these shapes over doors or windows. In the architecture of the middle ages small gables and triangular decorations over openings, niches, etc., are often called *pediments*. These generally have the angle at the apex much more acute than the corresponding gable or gablet in Roman architecture, which, on its part, is markedly higher in proportion, or less obtuse-angled at the summit, than Hellenic pediments. See also cuts under *acroterium*, *octastyle*, and *pedimented*.

They have the body entirely covered with bony plates, ankylosed on the trunk, and movable on the tail; the margin of the upper jaw formed by the intermaxillaries and their cutaneous extensions downward to the end of the maxillaries; the gill-cover formed by a large operculum, the interoperculum being a long fine bone hidden below the gill-plate; one rudimentary branchiostegal; one short dorsal and one anal fin opposite each other, pectorals horizontal, and ventral fins subabdominal and narrow. The species are confined to the Indo-Chinese seas. They have been variously approximated to the lophobranchs, to the acanthopterygians and especially the mail-cheeked fishes, and to the hemibranchs. They have been also regarded as representing a peculiar suborder or even order (*Hypostomides*). They are known as *flying sea-horses*.

Peggers using wooden pegs in a continuous band, or pegs of wire, cut off the pegs automatically and feed the single pegs or screws to the driving-mechanism. The operation of placing the pegs in the shoe is always under the control and guidance of the operator. See also cut under *peg-strip*.

Pelecanoides (pel′e-kā-noi′dēz), *n.* [NL. (Lacépède, 1800–1), < Gr. *πελεκάν,* a pelican, + *εἶδος,* form.] A singular genus of the petrel family, *Procellariidæ,* representing the subfamily *Pelecanoidinæ* (or *Halodrominæ*): so called from the width of the chin and distensibility of the throat, suggestive of a pelican's pouch. The bill is broad, and the nasal tubes are vertical, the nostrils opening directly upward, unlike those of any other petrel; and the wings are short, contrary also to the rule in this family. The birds dive with facility, and resemble little auks rather than petrels. Two or three species inhabit southern seas, as *P. urinatrix.* The genus is also called *Halodroma* and *Puffinuria.*

Pelecanoidinæ (pel-e-kan-oi-dī′nē), *n. pl.* [NL., < *Pelecanoides* + *-inæ.*] A subfamily of *Procellariidæ,* represented by the genus *Pelecanoides* alone. Also called *Halodrominæ.*

Pelecanus (pel-e-kā′nus), *n.* [NL., < LL. *pelecanus, pelicanus,* a pelican: see *pelican.*] The only genus of *Pelecanidæ,* having the bill slender and several times as long as the head, with a hook or nail at the end, and the mandibular rami divaricated, supporting an enormous pouch. The wings are extremely long, with very numerous remiges. The tail is short, and consists of 20 or more feathers; the feet are short and stout, and all four toes are webbed. (See cut under *totipalmate.*) The size is great, and the form is robust. The weight of the body in proportion to its bulk is reduced by its great pneumaticity. There are at least 6 perfectly distinct species, and some authors admit 9. Two inhabit the United States—the white and brown pelicans, *P. erythrorhynchus* and *P. fuscus.* (See cut under *pelican.*) The European species, inhabiting also Asia and Africa, are *P. onocrotalus* and *P. crispus.* The Australian is *P. conspicillatus;* and *P. rufescens* or *philippinus* is found in various parts of the Old World.

(Latreille, 1801), < Gr. *πελεκῖνος,* a pelican: see *pelican.*] A remarkable genus of hymenopterous insects, representing the family *Pelecinidæ.* The trochanters are one-jointed; the fore wings are without complete submarginal cells; the abdomen is petiolate, very long and slender, in the female at least five times longer than the head and thorax, but shorter in the male, and clavate; the antennæ are long, filamentous, not elbowed; and the body is polished-black.

Pg. *pelicano* = It. *pellicano* = D. *pelikaan* = G. Sw. Dan. *pelikan*, < LL. *pelecanus, pelicanus*, < Gr. πελεκάν, MGr. also πελεκῖνος, πελέκανος, or πελεκανός, a pelican. Cf. πελεκᾶς (πελεκαντ-), a woodpecker, < πελεκᾶν, hew or shape with an ax, < πέλεκυς = Skt. *paraçu*, an ax, a battle-ax.] 1. A large piscivorous natatorial bird of the family *Pelecanidæ* and genus *Pelecanus*, having an enormously distensible gular pouch. Pelicans of some species are found in nearly all temperate and tropical countries. Deriving their whole sustenance from the water, they frequent lakes, rivers, and sea-coasts, and generally secure their prey by wading or swimming and scooping it into their pouches; though some, as the brown pelican, swoop down on the wing, like gannets. They breed usually on the ground near water, laying from one to three eggs, white-colored, equal-ended, and of rough texture. They are gregarious, and gather in immense companies at their

breeding-resorts. The birds are about as large as swans, and their short legs constrain them to an awkward waddling gait, but their flight is easy, firm, and protracted. The sexes are colored alike. The plumage is in most cases white, variously tinted with yellow and rosy hues. The American white pelican, *P. erythrorhynchus*, is five feet long and eight or nine feet in extent of wings; the general plumage is white, with black primaries, and yellow lengthened plumes on the back of the head and on the breast. The bill is surmounted in the breeding-season by a curious horny crest which is deciduous. (See cut at *rough-billed*.) The brown pelican, *P. fuscus*, is of dark and varied colors, and rather smaller than the white species. The fable that the pelican wounds its own breast and feeds its young with the blood that flows from it has no foundation in fact so far as this bird is concerned. The young are fed on fish brought to the nest in the pouch, and doubtless often macerated to some extent in the gullet—a habit common to the other birds of the same order, as cormorants, gannets, etc. The myth probably arose in connection with the fabulous phenix, and may have been borne out by some facts which have been observed in the case of the flamingo (*Phœnicopterus*), possibly furthermore acquiring some plausibility, in its application to the pelican, from a red tint that is observable on the beak or plumage of some species. The pelican has from early times been considered as an emblem of charity. See also cut under *totipalmate*.
